Bachelor of Science (Honors/ Honors with Research) in Mathematics
SEMESTER-I

APPLIED CALCULUS

Course Code: DMTH2151 **Credit Units: 03**

Course Objectives: The objective of this course is to introduce the concepts of successive differentiation, higher order differentiation, partial differentiation and their applications; fundamentals of curve tracing.

Course Outcomes: On completion of this course, the students will be able to
CO1 : Learn the concept of successive differentiation and application of Leibnitz method.
CO2 : Learn the concept curvature and asymptotes.
CO3 : Learn how to trace the curve
CO4 : How to solve Partial differentiation, Euler's theorem and theorem for higher orderderivatives
CO5 : How to solve Taylor's expansion of a function in two variables, Jacobian and its properties,Maxima and minima of a function in two variables, Method of Lagrange's multipliers.

Course Contents:

Module-I: Differentiations
The real line and its geometrical representation. limit and continuity. Differentiability and differentials. Successive differentiation and Leibnitz Theorem, Rolle's Theorem, Mean Value Theorem, Taylor and Maclaurin's expansions. Partial differentiations& its applications: Homogeneous functions, Euler's Theorem, Toal Derivative, Composite function, Jacobians,Maxima & Minima for a function of two variables, Lagrange's method of undetermined multipliers.

Module-II: Applications
Asymptotes in cartesian coordinates, Intersection of curve and its asymptotes,Curvature,Radius of curvature (for cartesian curves, parametric curves, polar curves, pedal curves), Centre of curvature, Circle of curvature, Chord of curvature. Tracing of curves in Cartesian and polar coordinates.

Module-III: Multiple Integral
Review of integrals, Reduction formulae, Beta-Gamma functions,Double integral and evaluation,change of order of integration, change of variable, Triple integral and evaluation, Area using double integration, Volume as double and triple integration, Volume of solid by double integration.

Module-IV: Vector Calculus
Vector differentiation, directional derivatives, Gradient of a scalar point function, Divergence and curl of vector point function, Gradient, divergence and curl of sums and product and their related vector identities. Laplacian operator, Vector integration; Line integral, Surface integral, Volume integral, Theorems of Gauss, Green & Stokes (without proof) and problems based on these theorems.

APPLIED CALCULUS LAB

Course Code: DMTH2152 **Credit Units: 01**

Course Outcomes:

CO1: The main objective of the course is to make students familiar with MATLAB.
CO2: Students will be able to solve mathematical problems using the MATLAB software interface.CO3: Students will learn various inbuilt MATLAB functions related to calculus.
CO3: Students will be able to solve mathematical problems with help of coding.

Program No	Program Title	CO mapping
1.	Introduction to the software and basic commands of MATLAB	CO1
2.	To declare, initiate, save and run a function in MATLAB	CO1, CO2
3.	To use commands of Symbolic toolbox such as *diff, limit, int etc*	CO2, CO3
4.	To plot graphs using MATLAB.	CO3, CO4
5.	To find gradient, divergence and curl of a function using MATLAB.	CO2, CO3, CO4
6.	To compute area using double integration.	CO2, CO3, CO4
7.	To compute Volume using triple integration	CO2, CO3, CO4
8.	To find nth order derivative of trigonometric functions.	CO2, CO3
9.	To find nth order derivative of algebraic functions.	CO2, CO3
10.	To find Taylor's and Maclaurin's expansions of a given function.	CO2, CO3

DMTH2101	LINEAR ALGEBRA	L	T	P	C
Version	Date of Approval:Date, Month 2019	3	1	0	4

Course Objectives:

1. Fundamental of linear algebra
2. Fundamental of matrix theory

Catalog Description

The course will provide the how the system of equation can be solved. How a set can be formed vector space, subspace, null space, rank space. What is the relation between dimension, null space and rank space. How linear transformation related to matrix theory.

Course Outcomes : On completion of this course, the students will be able

CO1 : How to solve system of linear equation using elimination method (homogeneous and nonhomogeneous)

CO2 : Compute the inverse of matrix using Guass Jordan method

CO3 : Solve the polynomial matrix, characterstics equation, eigen value , eigen vectors

CO4 : Analyze various statement proof related to vector space

CO5 : Analyze rigorous mathematical proofs of statements related linear trasfromation and realtionwith matrix.

Course Content

Modules	Blooms Level*	Hours
Module-I Euclidean space R^n, and Matrices Fundamental operation with vectors in Euclidean R^n, Linear combination ofvectors, Dot product and their properties, Cauchy-Schwarz inequality, Triangle inequality, Projection vectors, Some elementary results on vectors in R^n.Matrices:Rank of matrix, Row echelon form, Normal form, Application of rank to solve homogenous and non-homogenous systems of linear equations. Eigen values, Eigen vectors, Cayley Hamilton theorem and its application, Diagonalization of matrices,	**L1, L2, L3, L4**	**12**
Module-II: Vector Spaces Vector space and its examples, Subspaces, linear spans space of a matrix , a spanning set for an eigenspace, Linear independence and linear dependence of vectors, Basis and dimension of a vector space, Maximal linearly independent sets, Minimal spanning sets. .	**L1, L2, L3, L4**	**12**

SEMESTER-II

DMTH2251	ORDINARY DIFFERENTIAL EQUATIONS	L	T	P	C
Version	Date of Approval:Date, Month 2019	2	1	0	3
Pre-requisites/Exposure	Differentiation and Integration				
Co-requisites					

Course Objectives : After completing the course, students will be able to solve various type of ordinary differential equations. arising from changes in physical world.

Catalog Description
The course will provide how to solve various differential equations using various methods.

Course Outcomes : On completion of this course, the students will be able to
CO1 : Learn how to formulate differential equation and solution of linear differential equation.
CO2 : Learn how to sole differential equation of first order but not first degree.**CO3 :** Learn how to solve the differential equation with constant coefficients. **CO4 :** Learn how to solve simultaneous differential equations.

Course Content

Modules	Blooms level*	Number of hours
Module I: Review & Equations of First order and First degree differential equations: Differential equations, Order and Degree of Differential Equations, Complete primitive (general solution, particular solution and singular solutions). Differential equations of first order and first degree, Separation of variables, Homogeneous Equations, Equations of the form dy/dx = ax+by+c/a1x+b1y+c1, Linear Equations, Equation reducible to the linear form, Exact differential equations, Equations reducible to exact form by using integrating factors	L1, L3, L4	12
Module II: Equation of First order but not of first degree & Trajectories Equation of First order but not of first degree, Various cases and various methods of solution, Clairauts form, Singular solutions, Trajectory, Orthogonal Trajectory, Self-Orthogonal family of Curves.	L1, L3	12

Module III: Module II: Equation of First order but not of first degree & Trajectories: Linear equations with constant coefficients, Complementary function, Particular integral, Working rule for finding solution for various cases, Homogeneous linear differential equations, Equations reducible to homogeneous form.	L1, L3	12
Module IV: Simultaneous Differential Equations & Linear Equations of Second Order with variable coefficients : Simultaneous differential equations, Differential equations of the form dx/P = dy/Q = dz/R where P, Q, R are functions of x, y, z. Linear Equations of second order with variable coefficients, following methods: (a) the complete solution in terms of a known integral, (b) finding one integral in C.F. by inspection, (c) removal of first derivative, (d) method of variation of parameters.	L1, L3	12

DMTH2201	GROUP AND RING THEORY	L	T	P	C
Version	Date of Approval: Date, Month 2019	3	1	0	4
Pre-requisites/Exposure	Basic Set theory				
Co-requisites					

Course Objectives:

1. Fundamental theorems and applications relevant to the study of Group, rings and fields
2. Analyze rigorous mathematical proofs of statements related to groups, rings and fields..

Course Outcomes:

On completion of this course, the students will be able to
CO1 : Learn the concept of Group and various groups.
CO2 : Learn fundamental theorems of group theory.
CO3 : Analyze rigorous mathematical proofs of statements related to groups**CO4 :** Analyze rigorous mathematical proofs of statements related to Rings **CO5 :** Analyze rigorous mathematical proofs of statements related to Field **Catalog Description**
The course will provide the how set theory is extended further and provides way to learning variousproofs of statements of groups, rings and fields.

Course Content

Modules	Blooms level*	Number of hours
Module I: Basics and Review Sets, Subsets, Operations on sets, Index set and family of sets, Relations, Equivalence relations and partitions, Mappings. Infinite sets and cardinality, Congruence modulo-n., Laws of composition.	L1, L3, L4	10
Module II: Groups Binary operation and Algebraic structure, Groups, Subgroups, Generators of a group, Permutation groups, Cyclic groups, Coset decomposition, Lagrange theorem and its consequences, Homomorphism and Isomorphism, Normal subgroups, Quotient group, Cayley's theorem	L1, L3	12
Module III: Groups Contd Fundamental theorems on homomorphism and isomorphism, Automorphism and inner automorphism, Automorphism groups and their computation, Normaliser and center of group, Group actions, Stabilizers and orbits, Finite groups, Commutor subgroups.	L1, L3	12

SEMESTER-III

DMTH2351	PARTIAL DIFFERENTIAL EQUATIONS	L	T	P	C
Version	Date of Approval: 2019	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Objectives : The objective of this course is to

1. Upon successful completion of this course, the student will be able to: (Knowledge based)
2. Classify partial differential equations and transform into canonical form;
3. Solve Non linear partial differential e using Charpit's method & Jacobi's method

Course Outcomes : On completion of this course, students should

CO1 : Classify partial differential equations and transform into canonical form.
CO2 : Student will be introduce to fundamentals of partial differential equations
CO3 : Learn solving linear PDEs using classical methods.
CO4 : Solve Non linear partial differential equation using Charpit's method & Jacobi's method..

Catalog Description

The student will be able to Solve Second order PDE with constant coefficients, Linear second order PDE with variable coefficients, classification of second order PDE& Homogeneous Differential equation. the student will be able to Transport Equation, Quasi linear equation, Laplace's equation, Analytic solutions of Laplace Equation in 2D Cartesian and polar coordinates, Interior & Exterior Dirichlet's problem, Neumann problem.

Heat equation, solution by method of characteristics, solution by separation of variables. Heat equation, solution by method of characteristics, solution by separation of variables.Students should be able to transform Laplace's equation from rectangular coordinate to radial coordinate and solve the resulting partial differential equation. the student will be able to Non linear first order PDE, generalizations, Non linear waves and shocks, conservation laws and shocks

Course Content

Modules	Blooms level*	Number of hours
Module I: Definition of Partial differential equation, order of partial differential equation, Formation of partial differential equations (a) by elimination of arbitrary constants (b) by elimination of arbitrary function, Linear and Quasilinear first-order PDEs. Complete solution, particular solution,	L1, L2, L4	12

DMTH2301	MATHEMATICAL METHODS	L	T	P	C
Version		3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Contents:

Module I Series solution of differential equations, Power series method, Definitions of Betaand Gamma functions. Bessel equation and its solution: Bessel functions and their properties- Convergence, recurrence, Relations and generating functions, Orthogonality of Bessel functions.
Module II Existence theorems for Laplace transforms, Linearity of Laplace transform and their properties, Laplace transform of the derivatives, Initial and final value theorems and Evaluation of Integrals of a function
Module III Inverse Laplace transforms, Linearity of Inverse Laplace transform, Shifting theorems (first and second), Convolution theorem. Solution of the differential equations using Laplace transforms.
Module IV Fourier series, Fourier expansion of piecewise monotonic functions, Half and full rangeexpansions, Fourier transforms (finite and infinite), Application of Fourier Transform in initialand boundary value problem. Fourier integral.

SMTH2301	FUNDAMENTALS OF C PROGRAMMING	L	T	P	C
Version		2	0	0	2
Pr-requisites/Exposure					
Co-requisites					

Course Outcomes : On successful completion of this course, all students will be able to:
CO1 : Understand binary, hexadecimal and octal number systems and their arithmetic.
CO2 : Define the purpose and structure of C Program for programming; identify and distinguish various datatypes and operators; conditional and control statement; Apply if-else, Switch and loops to rewrite basic C program for problem solving.
CO3 : Compare and contrast various Array types, its declaration and implementation; differentiate between Call by Value and Reference if Functions; apply the concepts to rewrite C Programs
CO4 : Differentiate between various String Handling Functions;

Catalog Description
This course is aimed to provide a fundamental understanding of programming concepts. C Language is the language which used to write solution for the basic computational problem in the form of instructions and programs.The basic and advanced features of C Language including Data types, Operators, Conditional & Control Statements, Arrays, Strings, Structure & Union and File Handling will be introduced.

Course Content

Modules	Blooms level*	Number of hours
Module-I: Computers fundamentals: definition, block diagram, diagram with components and characteristics, classification of computers History of C: Introduction of C, Basic structure of C program, Concept of problem solving, program design, debugging, Types of errors in programming, Number systems, Binary, octal, hexadecimal and their inter conversions.	L1, L2 and L3	08
Module-II: Element used in C, Header file, key words, identifiers, concept of variables, constants and data types in C, Input/output function, arithmetic, relational	L1,L2 and L3	08
and bitwise operator, increment and decrement operator, unary operator, type casting, operator hierarchy, Conditional operator		
Module-III: Decision making with if statement, else statement, if-else statement, nesting if, switch and break, go to statement. Decision making statement concepts of loops like while loop, do while loop, for loop, nested for loops, jumps in loop.	L1, L2 and L3	10

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module-IV: Functions: - use of inbuilt function, user defined functions, arrays:- one dimensional and n dimensional array, initialization of array, iterative programs using arrays, uses of array with combination of decision making operator, Function prototype, Return values and their types, function argument, recursion, Strings, array of strings.	L2, L3 and L4	10

**Bloom's Level:*
L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

SMTH2302	C PROGRAMMING LAB	L	T	P	C
Version		0	0	2	1
Pre-requisites/Exposure					
Co-requisites	NIL				

Catalog Description

The primary objective of this course is to understand all the components of C, including the Clanguage, the C Preprocessor, and the C Standard Library.

Course Objectives : The objective of this course is to

1. Equip the students with concepts of Programming through C Language
2. Provide an overview of programming concepts like Functions, Arrays and String Handling

Course Outcomes : On completion of this course, the students will be able to

CO1 : Demonstrate the use of various data types and operators in C programs; Solve variousproblems using conditional control statements (if-else, Switch case).

CO2 : Construct C programs related to problems involving the usage of loops, arrays andfunctions.

CO3 : Construct C programs using string handling functions.

Modules/Topics Covered**	Blooms level*	Number of hours
1. Basic programming to understand the working of C a. Write a program to calculate simple interest and amount. b. Write a program to swap two numbers using third variable. c. Write a program to calculate area of circle	L3	2
2. Programs using if, else if statements, switch case a. Write a program to check if the number is even or odd. b. Write a program to perform arithmetic operations using Switch Case statement. c. Write a program to demonstrate Greatest of 3 nos	L3	2
3. Programs using loops like while and do while (a) Write a program to find factorial of given no using do while statement. (b) Write a program to print prime numbers up to 'n'. (c) Write a program to sum of n natural no.	L3	2

SEMESTER-IV

DMTH2451	OPTIMIZATION TECHNIQUES	L	T	P	C
Version		2	1	0	3
Pre-requisites/Exposure					
Co-requisites	NIL				

Course Objective:

The problems in optimization are the most common applications of mathematics. The main aim of this course is to present different methods of solving optimization problems in the areas of linear programming.

Course Contents:

Module I: Introduction to Optimization techniques (OT)

Historical Development of OT models and advantages, Engineering applications of OT, Design vector and constraints, Classifications of Optimization problems

Module II: Linear Programming Problems (LPP)

Definition of LPP, General Structure of Linear Programming, Objective Function, Constraints, Constraint Surface, Formulation of LPP, Advantages and Limitations of Linear Programming, Graphical Solutionsof Linear Programming Problems. Simplex Method, Big M Method and Two-Phase Method, Degeneracy, Duality

Module III: Transportation and Assignment Problems

Introduction to Transportation Model, Degeneracy in TP, Solution Techniques of TP, Different Methods for Obtaining Initial Basic Feasible Solutions viz. Northwest corner rule, Matrix Minima Method, Row Minima Method, Column Minima Methods, Vogel's Approximation Method, Techniques for Obtaining Optimal Basic Feasible Solution – MODI Method.

Assignment Problems: Definition, Types of Assignment Problems, Hungarian Method for AP.

Module IV: Game Theory

Concept of Game problem. Rectangular games. Pure strategy and Mixed strategy. Saddle point and its existence. Optimal strategy and value of the game. Algebraic method, Graphical method and Dominance method of solving rectangular games. Inter-relation between the theory of Games and L.P.P

DMTH2452	OPTIMIZATION TECHNIQUES LAB	L	T	P	C
Version		0	0	2	1
Pre-requisites/Exposure					
Co-requisites	NIL				

Course Outcomes:

CO1: The main objective of the course is to make students familiar with tools for OptimizationTechniques using software interface.

CO2: Students will be able to visualize the mathematical problems graphically.

CO3: Students will learn various inbuilt functions related to Optimization Techniques.CO3: Students will be able to solve mathematical problems with help of coding.

Program No	Program Title	CO mapping
1.	Introduction to the software and basic commands of the interface	CO1
2.	To create objective function and constraint equations	CO1, CO2
3.	To plot the graphical solution of linear programming problems	CO2, CO3
4.	To solve the optimization problem using Simplex Method	CO3, CO4
5.	To solve the optimization problem using Big M Method and Two Phase Method.	CO2, CO3, CO4
6.	To implement dual simplex method.	CO2, CO3, CO4
7.	To construct a code for Transportation problem using Northwest corner rule.	CO3, CO4
8.	To find the row minima and row maxima in the transportation and assignment problems.	CO3, CO4
9.	To implement the procedure of elimination of rows in assignment problem.	CO1, CO3, CO4
10.	To solve and assignment problem using MATLAB.	CO3, CO4

DMTH2401	REAL ANALYSIS-I	L	T	P	C
Version	Date of Approval: 2019	3	1	0	4
Pr-requisites/Exposure					
Co-requisites					

Course Objectives: To expose the students to the basics of real analysis required for their subsequentcourse work. This course is intended to expose the basic ideas of Real Analysis. In particular,
To understand the basics of Real analysis
Have the knowledge of the sequence and series of real numbers, convergence, limits of functions, infinite products and their properties.
To make the students understand the fundamentals, study examples, memorize definitions and theorems and learn certain proof techniques.
Development of the mathematical skills to solve problems
Explain your solutions to others and present your ideas to other students.

Course Outcomes: On successful completion of this course, all students will have developed knowledge, understanding and their ability to apply knowledge of mathematics to the analysis.
CO1 : Describe fundamental properties of the real numbers that lead to the formal development of real analysis.
CO2 : Demonstrate an understanding of limits and how they are used in sequences, series, infinite product. Define and recognize the sequence and series of real numbers and convergence with examples.
CO3 : Construct rigorous mathematical proofs of basic results in real analysis. Understand and perform simple proofs.
CO4 : Appreciate how abstract ideas and rigorous methods in mathematical analysis can be applied to important practical problems.

Catalog Description
Mathematical analysis is central to mathematics curricula not only because it is a stepping-stone to the study of advanced analysis, but also because of its applications to other branches of mathematics, physics, and engineering at both the undergraduate and graduate levels.
To introduce students to the fundamentals of mathematical analysis. At the end of this course, students should: understand the axiomatic foundation of the real number system, understand the concepts of limits, continuity, compactness, differentiability, and integrability.

Course Content

Modules	Blooms level*	Number of hours
Module-I: Real Number System Algebraic and order properties of , Absolute value of a real number;	L1, L3	10

SMTH2401	PROGRAMMING WITH MATLAB	L	T	P	C
Version		0	0	6	3
Pre-requisites/Exposure	Algorithms and basic knowledge of programming				
Co-requisites					

Course Objectives : MATLAB is a scientific computing tool which covers almost all area of science and engineering. Students will be using MATLAB environment to solve various types of mathematicalproblems.

Course Outcomes : On completion of this course, the students will be able to
CO1 : Learn the basic concept of MATLAB
CO2 : Learn how to use matrix theory in MATLAB.
CO3 : Learn how to plot functions using plot functions and m file
CO4 : How to make script file and function file CO5 : How to use if, while, do while, for loop etc

Catalog Description
The course will provides the students how to use MATALB in scientific and mathematical way

Course Content

Programs	Blooms Level	Hours
1. Generating arrays and matrices and their manipulations 2. Introduction on few builtin functions 3. 2D and 3D plots, multiple plots using figure and subplot commands 4. Annotation of plots 5. Simple script files and editing them 6. Programs using If, else, nested if else, statements 7. Programs using switch case 8 Programs using loop structures 9 Introduction of function files 10 Introducing notion of sub-functions and nested functions 11 Solving IVPs using ode45 and other solvers	**L1, L2, L3, L4**

SEMESTER-V

DMTH2501	COMPLEX ANALYSIS	L	T	P	C
Version 1.1	Date of Approval: 2019	3	1	0	4
Pre-requisites/Exposure	Basic of Complex variable				
Co-requisites					

Course Objectives: The objective of this course module is toacquaint the students with the mathematics involved in basics of Complex Numbers, Analytic Function, Complex Integration, Theoremsand to get them familiar with various important applications in evaluating real integrals.

Course Outcomes : On completion of this course, the students will be able to
CO1 : Describe fundamental properties of the complex numbers that lead to the formaldevelopment of complex analysis.
CO2 : Demonstrate an understanding of De-Moivers Theorem and its applications, Exponential, Logarithm of a complex number and how they are used in further step. Provebasic results in complex analysis.
CO3 : Define and recognize the sequence and series of complex numbers and convergence withexamples. Determine whether a given function is differentiable, and if so
find its derivative. Use power series and line integrals to construct differentiable functions.
CO4 : Use Cauchy's integral theorem to compute line integrals. Define Taylor's and Laurent series, and determine residues. Use the residue theorem to compute several kinds of real integrals.
CO5 : Construct conformal mappings between many kinds of domain.

Catalog Description
This course is intended for giving knowledge of the Basic Concepts of complex variable and its properties, complex integration and describes the real integrals applications. To acquaint the students with the fundamental concepts of analyticity and make them capable of to solve any given related problems. To describe the conformal mapping and its applications to daily life problems.

DMTH2502	NUMERICAL METHODS	L	T	P	C
Version	Date of Approval: 2019	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Course Objectives: This course aims to introduce various techniques for finding approximate numerical solutions to mathematical problems for which exact or analytical solutions are either unavailable or practically inappropriate to use.
1. To learn various methods to solve mathematical, real life problems numerically.
2. Specifically to attain an insight about the concepts of calculus of finite differences, divided differences, numerical integration and differentiation.
3. To learn various numerical tools to algebraic and transcendental equations.

Course Outcomes : On successful completion of this course unit students will be able to
Students will be able to understand the nature and operations of Numerical Analysis, demonstrate familiarity with theories and concepts used in Numerical Analysis and identify the steps required to carry out a piece of research on a topic in Numerical Analysis, derivation of the Numerical Methods, studying their convergence rate and performance, applicability of the methods on different test examples. In particular,
C01 : Apply appropriate algorithms to solve selected problems, both manually and by writing computer programs.
C02 : Compare different algorithms with respect to accuracy and efficiency of solution.
C03 : Analyze the errors obtained in the numerical solution of problems.
C04 : Using appropriate numerical methods, determine the solutions to given system of linear equations.C05 : Using appropriate numerical methods, determine approximate solutions to algebraic and transcendental equations.
C06 : Using appropriate numerical methods, determine approximately integration and differentiation Of functions.

Catalog Description
Numerical methods are mathematical methods that are used to approximate the solution of complicated problems so that the solution consists of only addition, subtraction and multiplication operations. Numerical methods are very useful because they are suitable for the use with computers because computer processors can only add, subtract and multiply. Numerical methods, is approximation fast solution for mathematical problems. Such problems can be in any field in engineering and science.

Course Content

Modules	Blooms level*	Number of hours
Module-I: Solution of system of linear equations: **Direct methods**: Cramer's rule, Matrix inverse method, Gauss elimination and Gauss-Jordan method **Iterative methods**: Jacobi's method, Gauss-Seidal method.	L1, L3	12
Module-II: Solution of Transcendental equations: Initial approximation of the roots, Bisection method, Method of false position, secant method, iteration method, Newton-Raphson method and its convergence.	L1, L3	12
Module-III: Finite differences and interpolation: finite difference operators, their properties and their interrelations, finite difference tables, Newton's forward and Newton's backward interpolation formula, various central difference formulae including Stirling's formula, Bessel's formula. Divided differences: Operators and difference table, Newton's divided difference formula, Lagrange's interpolation formula.	L1, L3	12
Module-IV: Numerical differentiation and integration: Differentiation using Newtons forward and backward formula, Newton-Cotes quadrature formula - derivations & comparison of Trapezoidal rule, Simpsons 1/3 and 3/8 rules. Numerical solution of first order differential equations: Euler's method,modified Euler's method, Runge-KuttaIInd order and IVth order methods	L1, L3, L4	12

**Bloom's Level:*
L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

DMTH2503	NUMERICAL METHODS LAB	L	T	P	C
Version		0	0	2	1
Pre-requisites/Exposure					
Co-requisites					

Course Objective:
The objective of the course is to explain the most common numerical methods used in engineering analysis, when to use each method, and how to implement basic methods in a structured manner using C/ MATLAB's programming language.

Course Outcomes
On completion of this course, the students will be able to
CO1:Solve the Algebraic and Transcendental Equation by implementing Numerical methods using C.
CO2:Solve the sets of linear simultaneous equations and solve the problems using direct methods like Gauss – elimination method and iterative methods like Jacobi method, Gauss-Seidel iterationmethods by using
CO3: Solve integration problems by using Trapezoidal and Simpson's Rule ($1/3^{rd}$ and $3/8^{th}$) in CCO4: Solve differential equations by using Runga-Kutta method and Euler's Method in C.

Course Content

1. Write a program to solve the system of equations Ax = b using Gauss elimination method.
2. Write a program to solve the system of equations Ax = b using Jacobi Iteration method.
3. Write a program to solve the system of equations Ax = b using Gauss-Seidel method.
4. Write a program to find an initial approximation to solve transcendental equation of the form f (x) = 0.
5. Write a program to find the roots of an equation f (x) = 0 using Bisection method.
6. Write a program to find the roots of an equation f (x) = 0 using Iteration method.
7. Write a program to find the roots of f (x) = 0 using Newton Raphson method.
8. Write a program to find the roots of f (x) = 0 using Secant method.
9. Write a program to find the integral of a function using Trapezoidal rule.
10. Write a program to find the integral of a function using Simpson's 1/3rd and 3/8th rule.

DMTH2504	NUMBER THEORY	L	T	P	C
Version	Date of Approval: 2019	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Catalogue Description

Number theory is a branch of pure mathematics devoted primarily to the study of the integers and integer-valued functions. It is a vast and fascinating field of mathematics, sometimes called "higher arithmetic," consisting of the study of the properties of whole numbers. This course is intended for people who wantto gain knowledge about fundamentals of numbers.

Course Objectives : To introduce the students to the fundamental ideas of Number Theory: Students willbe able to understand the concept of encryption and decryption, Euler's Theorem and residues. This course will encourage students to think clearly and critically and to begin to be able to prove simple statements on their own. Students will be able to know about number system and how to solve a single equation with two or three unknowns.

Course Outcomes : On successful completion of this course unit students will be able to

CO1 : Define and interpret the concepts of divisibility, congruence, greatest common divisor, prime, and prime-factorization,

CO2 : Define Number theoretic functions and their properties.

CO3 : Apply the Law of Quadratic Reciprocity and other methods to classify numbers as primitive roots, quadratic residues, and quadratic non-residues,

CO4 : Solve the problems of encryption and decryptions.

CO5 : Produce rigorous arguments (proofs) centered on the material of number theory, most notably in the use of Mathematical Induction and/or the Well Ordering Principal in the proof of theorems.

DMTH2551	PROBABILITY THEORY	L	T	P	C
Version		3	1	0	4
Pre-requisites/Exposure	Basics knowledge of Statistics				
Co-requisites					

Course Objectives: The course aims to shape the attitudes of learners regarding the field of statistics. Specifically, the course aim to i) Motivate in students an intrinsic interest in statistical thinking. ii) Instil the belief that statistics is important for scientific research.

Course Contents:

Module-I: Measures of Central Tendency Arithmetic Mean (A.M.) Definition, Mode, Median, Partition Values: Quartiles, Deciles and Percentiles, Box Plot, Percentile ranks, Geometric Mean (G.M.) Definition, merits and demerits, Harmonic Mean (H.M.), Weighted Mean: Weighted A.M., G.M. and H.M., Combined mean.

Module II: Measures of Dispersion, Range, Quartile deviation, Mean deviation, Mean square deviation, Variance and standard Deviation, Combined variance (derivation for 2 groups), Combined standard deviation, generalization for n groups. Moments, Skewness, Kurtosis.

Module III: Probability Theory: Random experiments, sample point and sample space, event, algebra of events. Definition of Probability classical and relative frequency approach to probability; probability axioms, real random variables (discrete and continuous), cumulative distribution function, probability mass/density functions, Conditional probability, Baye's Theorem, mathematical expectation, moments, moment generating function, characteristic function.

Module-IV: Discrete and Continuous Distributions: Standard univariate discrete distributions such as binomial, Poisson, geometric, negative binomial, hypergeometric, and their properties; Standard continuous distributions such as normal, exponential, Beta distribution of first and second kind, Gamma distribution

DMTH2505	DISCRETE MATHEMATICS	L	T	P	C
Version		3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Objectives : The objective of the course is to introduce the fundamentals of Discrete Mathematics which includes Mathematical Logic, Boolean algebra and its Applications, Switching circuit & Logic Gates, Graphs and Trees. The students shall also be introduced to computational andalgorithmic aspects of Mathematical Logic,
Boolean Algebra, Graphs and Trees in the field of Computer sciences and its applicationsFollowing are the striking features of this course:

1. In theoretical computer science courses the discrete mathematics is used quite extensively
2. Discrete mathematics has really come into its own with the development of computer.
3. To develop logical thinking and its application to computer science (to emphasize the importance of proving statements correctly and de-emphasize the hand-waving approach towards correctness of an argument). The subject enhances one's ability to reason and ability to present a coherent and mathematically accurate argument.

Course Outcomes : On successful completion of this course unit students will be able to
C01 : Write an argument using logical notation and determine if the argument is or is not valid.
The subject enhances one's ability to reason and ability to present a coherent and mathematically accurate argument.
C02 : Simplify and evaluate basic logic statements including compound statements, implications, inverses, converses, and contrapositives using truth tables and the properties of logic. Be skillful in expressing mathematical properties formally via the formal language of propositional logic and redicate logic.
C03 : Determine if a given graph is simple or a multigraph, directed or undirected, cyclic or acyclic, and determine the connectivity of a graph. Represent a graph using an adjacency list and an adjacency matrix and apply graph theory to application problems such as computer networks. Determine if a graph has an Euler or a Hamilton path or circuit.
C04 : Determine if a graph is a binary tree, N-ary tree, or not a tree; use the properties of trees to classify trees, identify ancestors, descendants, parents, children, and siblings; determine the level of a node, the height of a tree or subtree and apply counting theorems to the edges and vertices of a tree.
C05 : Perform tree traversals using preorder, inorder, and postorder traversals and apply these traversalsto application problems; use binary search trees or decision trees to solve problems.

Catalog Description
Discrete mathematics is the study of mathematical structures that are fundamentally discrete rather than continuous. In contrast to real numbers that have the property of varying "smoothly", the objects studied in discrete mathematics – such as integers, graphs, and statements in logic– do not vary smoothly in this way, but have distinct, separated values. Discrete mathematics therefore excludes topics in "continuous mathematics" such as calculus or Euclidean geometry. Discrete objects can often be enumerated by integers. It is

Prof. (Dr.) Anil Kumar

SEMESTER-VI

DMTH2601	REAL ANALYSIS-II	L	T	P	C
Version 2019.1	Date of Approval: 2019	3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites	Nil				

Catalogue Description

This course provides an introduction to the integration and Riemann integral, Integrability ofcontinuous and The Fundamental theorem of integral calculus. Topics discussed in the courseinclude Improper integrals and their convergence, Dirichlet's tests, Frullani's integral, Integral, Continuity, Differentiability and integrability of an integral of a function of a parameter and theirproperties with examples. Also topics discussed metric spaces, neighborhoods, limit points,interior points, open and closed sets, closure and interior, boundary points, Cauchy sequences,completeness, Cantor's intersection theorem, Baire's category theorem and their properties. Tostudy of application metric space: Continuous functions, compactness for metric spaces,sequential compactness, Bolzano-Weierstrass property, finite intersection property, continuity in relation with compactness, connectedness.

Course Objectives : At the end of this course, students should: understand the axiomatic foundation of integration of real valued function and convergence of improper integral. Students will be able to deal with abstract concepts of metric space and related concepts.

Course Outcomes : After completing the course, the students will be able to

CO1 : Explain the basic concepts of Integration. Describe Riemann integral, Integrability of continuous and monotonic functions.

CO2 : Knowledge and Understanding: Learn the theory of differentiability.

CO3 : Knowledge Understanding of Improper integrals and their convergence and Test: Comparison tests, Abel's and Dirichlet's tests, etc.

CO4 : Determine if a function on a metric space is discontinuous, continuous, or uniformly continuous.

CO5 : Apply your understanding of the concepts, formulas, and problem solving procedures to thoroughly investigate relevant physical models and Intellectual Skills: Develop a reasonedargument in handling problems about functions.

DMTH2651	MATHEMATICAL STATISTICS	L	T	P	C
Version		2	1	0	3
Pre-requisites/Exposure	Basics knowledge of Statistics				
Co-requisites					

Course Objective: To introduce the fundamentals of probability theory and random processes. The main objective of this course is to acquaint students with some basic concepts in Statistics. They will be introduced to some elementary statistical methods of analysis of data.

Course Contents:

Module-I: Covariance and correlation between two variables, scatter diagram , Karl Pearson's coefficient of correlation, Rank correlation coefficient, Multiple correlation, Curve fitting, Linearand nonlinear regression, Simple linear regression.

Module II: Convergence in Probability Modes of convergence of sequences of random variables, Independent and Identically Distributed Variables, Weak and Strong laws of large numbers, Central limit theorems, Chebychevs Inequality, Markov Inequality, Kolmogorov Inequality

Module III: Random Sampling: Introduction, types of sampling, standard error, Test of significance, critical region, level of significance, error in sampling, Sampling distributions chi- square, T and F distributions. Testing of Hypothesis: Null hypothesis, alternative hypothesis, Important tests based on normal, Chi-square, T and F distributions. One way ANOVA; Two-wayANOVA.

Module IV: Point Estimation: Probabilities of point estimates, Cramer Rao Inequality, Methodof maximum likelihood, method of moments, least square methods, Unbiasedness, Efficiency, Sufficient, Consistency.

Co-requisites					

Catalog Description

This course is intended for students to learn different statistical tools. .

Course Objectives:

The objective of this course is to:

Acquaint students to use statistical software in computation and interpretationof various statistical results.

Course Outcomes:

On successful completion of this course, students will be able to:

CO1: Compute the mean, median, mode, correlation and regression.

CO2: Solve discrete and continuous Probability Distribution.

CO3: Interprete the significance of the sample.

CO4: Compute Eigen values and Eigenvectors of amatrix.

Course Content

Modules		
1. Measurement of CentralTendencies 2. Measurement of Dispersion 3. Measurement of Skewness &Kurtosis 4. Analysis of Correlation &Regression		
5. Binomial distribution 6. Poisson distribution 7. Normal distribution		
8. T- Test, 9. F-test,		

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis,L6-Evaluation*

DMTH2604	ANALYTICAL GEOMETRY	L	T	P	C
Version	Date of Approval: 2019	3	1	0	4
Pre-requisites/Exposure	Basic knowledge of geometry				
Co-requisites					

Course Objectives : The objective of this course is to provide a numeric description of thesegeometric objects and their properties

Course Outcomes : On completion of this course, the students will be able to
CO1 : Learn the concept of planes and geometrical applications.
CO2 : Define the concept of lines, skew lines and shortest distance between lines.
CO3 : Apply the concept of sphere and cone in practical problems.
CO4 : Apply the concept of cylinders in daily life

Catalog Description
The course will provide how to deal the object like polygonal line, a polygon, a polyhedron. Some curvilinear forms are also considered: a circle, a cylinder, a cone, a sphere, and three dimensiosnal objects.

Course Content

Modules	Blooms level*	Number of hours
Module I: Vectors: Three dimensional vectors: direction cosines, resolution of vectors, section formula, dot and cross products, triple products, geometrical and physical applications. Planes: Equation of a plane, normal to a plane, distance from a point to a plane, parallel planes, planes through the intersection of two planes, planes bisecting the angle between two planes, planes through three given non-collinear points, geometrical applications.	L1, L3	12
Module II: Lines: equation of a straight line in different forms; condition for a line to lie on a plane; condition for two lines to intersect; skew lines; equation and magnitude of the shortest distance between two skew lines	L1, L3	12
Module III: Sphere, Cone, Cylinder: Equation of a sphere, tangent plane and normal at a point of the sphere, orthogonal spheres, equation of a cone with guiding curve a circle, ellipse etc., equation of a right circular cylinder.	L1, L3, L4	12

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

DMTH2603	MATHEMATICAL MODELING	L	T	P	C
Version	Date of Approval: Date, Month 2019	3	1	0	4
Pre-requisites/Exposure	Mathematical modeling through Differential equations				
Co-requisites					

Course Objectives : Mathematical modeling is a process of creating a mathematical representation of some phenomenon in order to gain a better understanding of that phenomenon. The main goal of this course is to learn how to make a creative use of some mathematical tools such as difference equations, ordinary and partial differential equations, Numerical analysis to build a mathematical description of some physical problems.

Course Outcomes : On completion of this course, the students will be able to:
CO1 : Understand what functionals are, and have some appreciation of their applications.
CO2 : Apply the formula that determines stationary paths of a functional to deduce thedifferential equations for stationary paths in simple cases.
CO3 : Use the Euler-Lagrange equation or its first integral to find differential equations forstationary paths.
CO4 : Solve differential equations for stationary paths, subject to boundary conditions, instraightforward cases.
CO5 : Distinguish between the different types of integral equations, relate these integral equations to corresponding initial or boundary value problems and solve Fredholm integral equations of the second kind with degenerate kernel.
CO6 : Formulate boundary value problems modelling waves on a string, and apply theNeumann series solution for a corresponding Fredholm integral equation of the second kind to analyze scattering of waves in one dimension.

Catalog Description
This course is a basic course offered to PG students of Engineering/Science background. It contains Mathematical modelling through Ordinary Differential Equations. Therefore, it has tremendous applications in diverse fields in engineering sciences.

Course Content

Modules	Bloom slevel*	Numbe r of hours
Module I: Mathematical modelling through Ordinary Differential Equations and Systems of Oridnary Equations of First Order : Linear Growth and Decay Models, Non-linear growth and Decay models, Compartment models, Mathematical Modelling in Population Dynamics, Mathematical modeling of Epidemics, Mathematical modeling in medicine, arms race battles and international trade, Mathematical modeling in dynamics.	L1, L3 ,L4	12

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

DMTH2602	FINANCIAL MATHEMATICS	L	T	P	C
Version	Date of Approval: Date, Month 2019	3	1	0	4
Pre-requisites/Exposure	Mathematical modeling through Differential equations				
Co-requisites					

Course Objective : The course introduces fundamental concepts of Financial Mathematics such as cash flows, present value, future value, yield and probability that form the basis for further advanced learning.

Course Outcomes : After completing the course the student will be able to
CO1 : Demonstrate understanding of basic concepts in linear algebra, relating to linear equations,matrices, and optimization.
CO2 : Demonstrate understanding of concepts relating to functions and annuities
CO3 : Employ methods related to these concepts in a variety of financial applications.

Course Content

Modules	Blooms level*	Number of hours
Module I: Random Variable Discrete and Continuous, Probability Distributions Binomial, Poisson and Normal, Basics of Stochastic Process, Markov Process, Martingales.	L1, L4	10
Module II: Derivative Securities, time value of money, Cash flow, money market, coupon bonds, Money market account.	L1, L3	8
Module III : Forward and futures contracts Forward price formula, value of a forward contract,. Futures contract, Futures pricing. Swaps, value of commodity swaps.	L1,L2,L3	8

DMTH2605	FUZZY THEORY	L	T	P	C
Version	Date of Approval : 2019	3	1	0	4
Pre-requisities / Exposures	Basic Set Theory				
Co-requisites					

Course Objectives: The objective of this course is to understand the concepts of fuzzy sets, knowledge representation using fuzzy rules, approximate reasoning, fuzzy inference systems, fuzzy logics and other applications of fuzzy logic.

Course Outcomes : On completion of this course, the students will be able to
CO1 : Learn crisp and fuzzy set theory and decide the difference between crisp set and fuzzy set theory.
CO2 : Make calculation on fuzzy set theory.
CO3 : Recognize fuzzy membership function and its application.
CO4 : Analyse statistical data by using fuzzy logic method.
CO5 : Evaluate fuzzy statistic applications.

Catalog Description
The course will providean understanding of the basic mathematical elements of the theory of fuzzy sets. Provide an emphasis on the differences and similarities between fuzzy sets and classical sets theories. The main objective of this course is to establish thorough background knowledge on fuzzy sets in under graduate students and enable them to pursue individual research in solving real world optimization problems.

Course Content

Modules	Blooms Level*	Number of Hours
Module I: Background of fuzzy sets, Crisp sets-operation on crisp sets, fuzzy sets, fuzzy set operation, Properties of fuzzy sets, Expansion of fuzzy set, Interval value fuzzy set, Type-2 fuzzy set, L-fuzzy set, Level-2 fuzzy set. Membership functions, Features to membership functions.	**L1, L2, L3, L4, L6**	**8**
Module II: Alpha cut set, additional properties of Alpha -cut, Support, Core and height of -cut set, Cardinality of fuzzy set, First and second decomposition theorem, Functions of fuzzy sets-extensionprinciple, Cartesian product, Extension principle on Cartesian product.	**L1, L2, L3, L4, L6**	**8**

SEMESTER-VII

DMTH2701	MEASURE THEORY	L	T	P	C
Version	Date of Approval: 2017	3	1	0	4
Pre-requisites/Exposure	Riemann integral, convergence of sequence and series				
Co-requisites	NONE				

Catalog Description

The course introduces the students to the fundamental ideas of uniform convergence Measure of a set, measurable sets and Lebesgue Integral. The module should encourage students to think clearly and critically and to begin to be able to prove simple statements on their own.

Course Objective*:*

By the end of the course, students will have learned the basics of measure theory and have a solid understanding ofLebesgue integrable functions and Lebesgue measurable sets.

Course Outcomes:

On successful completion of this course, students will be able to:
After completed course, the students are expected to be able to:
CO1-Describe basic properties of sigma-algebras and the Lebesgue integral
CO2 -Explain the construction of the Lebesgue measure on Euclidean space
CO3- Describe the relationship between continuous functions and general integrable functions
CO4- Work with Lebesgue-Stieltjes integral on the real line.
CO5- Determine questions related to different kinds of convergence, like Lp-convergence, convergencein measure and convergence almost everywhere
CO6 - Describe the main ideas of the proofs for the Fubini-and Radon-Nikodym theorem

Course Content

Modules	Blooms level*	Number of hours
Module-I: Sequences and series of functions, Pointwise and uniform convergence, Cauchy criterion for uniform convergence, Uniform convergence and continuity, Uniform convergence and differentiation, Weierstrass approximation theorem.	L1, L2,L3	12

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana

DMTH2702	ABSTRACT ALGEBRA	L	T	P	C
Version	Date of Approval: 2017	3	1	0	4
Pre-requisites/Exposure	Basic algebra				
Co-requisites					

Catalog Description

The course will provide the knowledge about nature of groups, subgroups, quotient groups, rings, subrings, ideals, quotient rings, fields and the associated mappings and modules.

Course Objectives:

The objective of the course is to:

Analyze the concept of groups, rings and modules.

Course Outcomes

On completion of this course, the students will be able to:

CO1. Describe the concept of groups and fundamental theorem and also Sylow's Theorems for abelian andnon abelian groups.

CO2. Explain the concept of solvable groups, nilpotent groups, direct product of groups, structure theorem for finite abelian groups

CO3. Describe the fundamentals of rings and related theorems, ideals, maximal ideals, quotient rings, Integral Domains, Fields.

CO4: Explain the concept of Modules, Definition and examples, Direct sum, Free modules, Quotient modules, Simple modules .

Course Content

Modules	Blooms level*	Number of hours
Module- Groups, symmetric groups, Cayleys theorem, Normal subgroups, center of a group, quotient groups, Fundamental theorem on homomorphisms, Class equation of groups, Cauchys Theorems for abelian and non abelian groups, Sylow's Theorems for abelian and non abelian groups, solvable groups	L1, L2, L3, L4	12

DMTH2704	MECHANICS	L	T	P	C
Version	Date of Approval:2017	3	1	0	4
Pre-requisites/Exposure	Electricity and Magnetism, Statistical Mechanics, and Quantum Mechanics, Condensed matter Physics and Material Science				
Co-requisites	Basic understanding of Mathematics e.g. Basic Calculus is needed				

Catalog Description

This course provides basic knowledge and understanding of Netonian mechanics and focuses on educating the students about various physical laws such as virial's theorem, D'Alembert's Law and Liouville's theorem etc. Knowledge of basic Classical mechanics is crucial to comprehend the contents of this course. This course serves as a prerequisite for better understanding of advanced dynamical problems.

Course Objectives

The objective of this course is to:
A detailed exposition of classical mechanics for the student, opting for physics is sovitally important for a clear understanding of recent intricate theories of quantum mechanics, modern physics and research for they are built an well developed and conceptualized foundation.

Course Outcomes

On completion of this course, the students will be able to:
CO1: Describe Lagrangian approach to solve advanced problem involving the dynamic motionof classical mechanical systems.
CO2: Define the Hamiltonian approach for solving the dynamic motion of the systems and todemonstrate an intermediate knowledge of central -force motion
CO3: Explain how to Apply advanced methods to complex central-force motion problems. CO4: Describe how to use conservation of energy and linear & angular momentum to solve dynamics problems. Describe the conservation laws and to apply them for solving numericalproblems.

Course Content

Modules	Blooms level*	Number of hours
Module 1: Lagrangian Formulation Mechanics of a system of particles, constraints, D'Alembert's principle, Variational calculus and itsapplications, Hamiltonsvariational Principle, Lagrangian equations, applications of Lagrangian formulation, conservation theorems and symmetry properties, applications of Lagrangian formulation	L1, L2	10

Module 2: Central Force Problem Reduction to one body problem, equation of motion and first integral, one dimensional problem and classification of orbits, Differential equation for the orbit, Kepler problem and planetary motion, Rutherford formula, scattering in central force field, transformation to laboratory frames.	L3, L4	8
Module 3: Rigid Body and Vibrating System Euler angles, tensor of inertia, kinetic energy of a rotat- ing body, symmetric top and applications. Vibrating string, solution wave equation, normal vibrations, dispersion, coupled vibrating system. Non linear Dynamics, phase trajectories.	L2, L3, L4	10
Module 4: Hamiltonian Formulation Hamiltonian equation of motion, Hamiltons equation in differentco-ordinate systems example in Hamiltonian dynamics, two- dimensional harmonic oscillator the equations of canonical transformations, cyclic coordinates, phase space and Liouvilles theorem, Poisson bracket. Lagrange brackets, general poisson bracket under canonicaltransformation.	L2, L3	12

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DMTH2705	ADVANCED DIFFERENTIAL EQUATIONS	L	T	P	C
Version		3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Contents:

Module-I:
Existence and uniqueness theorem, Lipschitz condition, Solution of linear differential equations, Wronskian.

Module-II:
Solution of linear differential equations of second order, series solution, Legendre function,Bessel function and hypergeometric function.

Module-III:
Second order PDE equations with variable coefficients, Classification and canonical forms of second order equations in two variables. Classification of second order equations in n variables. Characteristic curves of second order equations in two variables.

Module-IV:
One and two dimensional wave equation, solution by method of characteristics and Fourier seriesmethod. solution of homogeneous and non-homogeneous diffusion equation, Duhamel's principle.

DMTH2706	SCIENTIFIC WRITING WITH LATEX	L	T	P	C
Version	1	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Objectives:
The objective of this course is to learn Typesetting of journal articles, technical reports,thesis, books, and slide presentations. Control over large documents containing sectioning, cross-references, tables and figures. Typesetting of complexmathematical formulae.

Course Contents:

Module 1: Introduction of LaTex, Installation of Latex, Required Components of aLATEX Document, Document Structure: Page Numbering and Headings, Creatingtitle page, Abstracts, Sections, subsectionupto level 3, Cross-References,Table of Contents.

Module 2: Mathematical Typesetting: Mathematical Formulas, Superscripts and Subscripts, Above and Below, Functions, Text in Math Displays,spacing: Spacing Between Words, Double spacing, Numbering/Listing: Enumerate command, Itemize command, Nested.

Module 3: Tables: Construction of table, Multi column, multi-row command in table, sideways, caption of table, resize of tables, Graphics: Figure, sub-figure, combined figure,wrap figure with text, caption of figure, labelling of figure, Bibliography, Hyperlinking. Application: CV writing, Journal/conferencetemplates, book writing.

Module 4: Presentation: Introduction of beamer, frame, blocks, style, fonts, colour,Wrap figure with text, Minipage, footnote.

DMTH2707	NUMBER THEORY & CRYPTOGRAPHY	L	T	P	C
Version 1.1	Date of Approval: 2017	3	1	0	4
Pre-requisites/Exposure	Basic Knowledge of abstract algebra				
Co-requisites					

Course Objectives:
The course provides an introduction to basic number theory, where the focus is oncomputational aspects with applications in cryptography. Moreover, the course provides an introduction to some basic cryptographic techniques to understand fundamental mathematical concepts underlying digital signatures, public key encryption, and key establishment protocols.

Course Outcomes:-After completion of course student will able to
CO1: Define the various fundamental theorems of arithmetic.
CO2: Discuss Combinatorial Study of $\phi(n)$, Formulae for d(n) and $\sigma(n)$, MultiplicativeArithmetic Functions, The Mobius Inversion Formula.
CO3:Describe cryptographic Hash Functions Hash functions and data integrity, securityof Hash functions
CO4: Solve different Fuzzy Applications.

Course Contents:

Modules	Blooms Level*	Hours
Module-I: Euclid's division lemma, Divisibility, The Linear Diophantine Equation, The fundamental theorem of Arithmetic, Fermat's Little theorem, Wilson's Theorem, Generating functions. Congruences, Residue Systems, The Theorems ofFermat and Wilson Revisited, The Chinese Remainder Theorem.	**L1, L2, L3**	**10**
Module-II: Combinatorial Study of $\phi(n)$, Formulae for $d(n)$ and $\sigma(n)$, Multiplicative Arithmetic Functions, The Mobius	**L1, L2,L3**	**12**
Inversion Formula, Primitive Roots Modulo p, Tchebychev's Theorem. Euler's Criterion, the Legendre Symbol, The Quadratic Reciprocity Law, Consecutive Residues and Non-residues.

DMTH2703	INTEGRAL EQUATIONS AND CALCULUS OF VARIATIONS	L	T	P	C
Version	Date of Approval: 2017	3	1	0	4
Pre-requisites/Exposure	Solutions of Differential equations, Evaluation of definite integrals				
Co-requisites					

Catalog Description

This course is a basic course offered to PG students of Engineering/Science background. It contains Fredholm and Volterra integral equations and their solutions using various methods such as Neumann series, resolvent kernels, Green's function approach and transform methods. It also contains extrema of functional, the Brachistochrone problem, Euler's equation, variational derivative and invariance of Euler's equations. It plays an important role for solving various engineering sciences problems. Therefore, it has tremendous applications in diverse fields in engineering sciences.

Course Objectives:

The objective of this course is to:

- Cover important techniques namely, variation technique, Transforms and Integral equationsmethods.
- Solution of ordinary and partial differential equations involving initial and boundary valueconditions.

Course Outcomes:

On completion of this course, the students will be able to:

CO1. Identify what functional are and have some appreciation of their applications.

CO2. Explain the formula that determines stationary paths of a functional to deduce the differential equations for stationary paths in simple cases.

CO3. Describe the Euler-Lagrange equation or its first integral to find differential equations for stationary paths.

CO4. Solve the differential equations for stationary paths, subject to boundary conditions and determine the solution of Fredholm integral equations of the second kind with degenerate kernel.

Module I-Definition and classification of linear integral equations. Conversion of initial and boundary value problems into integral equations. Conversion of integral equations into differential equations. Integro differential equations.	L1, L3, L4	12
Module-II :Fredholm Integral Equations: Solution of integralequations with separable kernels, Eigenvalues and Eigenfunctions. Solution by the successive approximations, Numann series and resolvent kernel. Solution of integral equations with symmetric kernels, Hilbert-Schmidt theorem, Green's function approach.	L1, L3	12
Module-III Volterra Integral Equations: Successive approximations, Neumann series and resolvent kernel. Equations with convolution type kernels.	L1, L3, L4	12
Module-IV: Calculus of Variations: Basic concepts of the calculus of variations such as functionals, extremum, variations, function spaces. Necessary condition for an extremum, Euler's equation with the cases of one variable and several variables. Invariance of Euler's equations. Functionals dependent on one or two functions and relatedproblems.	L1, L3, L4	12

DMTH2710	**STATISTICS INFERENCE WITH LAB**	L	T	P	C
Version	Date of Approval	3	0	1	4
Pre-requisites/Exposure					
Co-requisites					

Course Objective: The course aims at providing an introduction to statistical inference and itsapplication to predictive statistical models.

Learning Outcome: After completing the course, the student will be able to:
CO1:Demonstrate knowledge and understanding of: Test a hypothesis concerning the distribution ofa random variable.
CO2: Derive suitable point estimators of the parameters of the distribution of a random variable andgive a measure of their precision.
CO3:Use computational methods to obtain and evaluate estimators.
CO4: Demonstrate the use of various software on sampling distribution.

Course Content

Modules
Module-I Random Sampling: Introduction, types of sampling, standard error, Test of significance, critical region, level of significance, error in sampling, Testing of Hypothesis: Null hypothesis, alternative hypothesis, Sampling distributions chi-square, T and F distributions. , One way ANOVA; Two-way ANOVA
Module-II: Convergence in Probability Modes of convergence of sequences of random variables, Independent and Identically Distributed Variables, Weak and Strong laws of large numbers, Central limit theorems, Chebychevs Inequality, Markov Inequality, Kolmogorov Inequality.
Module-III: Point Estimation: Probabilities of point estimates,
Cramer Rao Inequality, Method of maximum likelihood, method of moments, least square methods, Unbiasedness, Efficiency, Sufficient,Consistency.

Module IV: By using MATLAB/ Mathematica/Maple:

1. To test one -sample and two sample hypothesis testingproblems by using t-test.
2. To test one -sample and two sample hypothesis testingproblems by using Chi-square Test.
3. To test one -sample and two sample hypothesis testingproblems by F-test.
4. To analyze the data using one- way analysis of variance(ANOVA).
5. To analyze the data using two- way analysis of variance(ANOVA).

DMTH2708	SCIENTIFIC TOOLS FOR RESEARCH	L	T	P	C
Version	Date of Approval	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Objective:
The course aims to provide in-depth knowledge of research design and methodology and to train the student in writing a study plan and critically reviewing scientificlitterature.

Course Outcomes:
On completion of the course, the student should be able to:
CO1:Searchliterature review, different scientific research designs and methods
CO2: understand about the various software like MS word, LaTex, Mendeley, Jabref etc.
CO3: Understand correct ways to refer to and cite from scientific literature.
CO4: prepare a Latex document, to make scientific article and project report.

Modules		
Module I: Introduction about the journal, conferences, books, books proceedings, Introduction about the literature, literature search, how to download literatures, reviewing the literatures.		
Module II: Introduction of LaTex, Installation of Latex, Required Components of a LATEX Document, Document Structure: Page Numbering and Headings, Creating title page, Abstracts, Sections, subsection upto level 3, Cross-References, Table ofContents.		
Module III: Mathematical Typesetting: Equations, Tables,figures, Bibliography, Hyperlinking. Application: CV writing, Journal/conference templates, book writing.Presentation: Introduction of beamer, frame, blocks, style, fonts, colour, Wrap figure withtext, Minipage, footnote.		
Module IV: Introduction about the references/ Biblography, Introduction of the Jabref/Mendeley for the references formation in documents,

DMTH2739	BASICS OF RESEARCH METHODOLOGY, ETHICS, AND RESEARCH COMMUNICATION	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description

This course aims to provide students with a comprehensive understanding of conducting ethical research, utilizing proper research methodologies, and effectively communicating research findings. The course includes a final project where students will write a Literature Review on a topic chosen in consultation with the teacher(s).

This course is designed to equip students with essential skills and knowledge to conduct ethical research, employ proper research methodologies, and effectively communicate scientific information (with focus on writing a literature review). The course will cover topics such as research design, data collection and analysis, research ethics, and science communication strategies. Through a combination of lectures, discussions, case studies, and practical exercises, students will develop a deeper understanding of the research process and its ethical implications.

Course Objectives

The objective of this course is to impart knowledge about various stages of research process, research ethics and different ways of research communication.

The aim of this course is to impart research skills to the beginners and help to improve the quality of research by the existing researchers. It also encompasses the understanding and application of appropriate research design, statistics, and the use of the computer for reference management, report writing, research paper writing and presentation. The course also introduces the key conceptual issues of each research method, as well as giving practical guidance. It covers the series of research methodology contents: from problem formulation, to design, to data collection, analysis, reporting and dissemination. The course has the dual aims of equipping students with conceptual understandings of current academic debates regarding different methods, and the practical skills to put those methods into practice.

Course Outcomes

On completion of this course, the students will be able to

CO1. Define criteria of good research, steps in research process, and data collection.
CO2. Identify different types of sampling and its purpose.
CO3. Conduct hypothesis testing for different types of samples and interpret the results.
CO4: Learn the importance of literature review, write research paper/thesis, use reference management software.

SEMESTER-VIII

DMTH2801	ADVANCED COMPLEX ANALYSIS	L	T	P	C
Version 1.1	Date of Approval: 2017	3	1	0	4
Pre-requisites/Exposure	Basic properties of Complex variable				
Co-requisites					

Catalog Description

This course is intended for giving knowledge of the basic concepts of complex variable and its properties, complintegration and describes the real integrals applications. To acquaint the students with the fundamental concepts analyticity and make them capable of to solve any given related problems. To describe the conformal mapping and applications to daily life problems likes' steady temperature, electro static potential, two dimensional fluid flows, a stream function problems. It gives the exposure of the applications of residue/contour integration like Poisson integrformula, and Dirichlet problem in the unit disc.

Course Objectives

The objective of this course is to:

- Acquaint the students with the mathematics involved in basics of complex numbers, analytic function, complintegration, theorem.
- Get them familiar with various important applications in evaluating real integrals.

Course Outcomes

On completion of this course, the students will be able to:

CO1. Define the basic concepts of analytic function and their properties with examples.

CO2. Describe the students the fundamental concepts of complex integration such as Cauchy's Integral Formula (CIF) atheir properties. Also application of CIF: Cauchy Inequality, Liouville's Theorem, Fundamental Theorem of Algebra.

CO3. Describe the conformal mapping and its applications: Bilinear Transformations and mappings from disc to disc, dito half plane, and half plane to half plane

CO4. Apply Cauchy's integral theorem to compute line integrals. Define Taylor's, Laurent series and to determine residuof function. Use the residue theorem to compute several kinds of real integrals.

DMTH2802	FRACTIONAL CALCULUS	L	T	P	C
Version	Date of Approval:2022	3	1	0	4
Pre-requisites/ Exposure	Nil				

Course Objectives:

1.To study special functions and their properties.
2 To study Riemann–Liouville differential and integral operators.3 To study Caputo fractional derivative.
4 To examine existence and uniqueness for Riemann–Liouville fractional differential equations.5 To find exact solution of some fractional differential equations.
6 To use numerical methods to find approximate solution of fractional differential equations. 7 To recognize some new nonclassical definitions of fractional derivatives and integrals.

Course Outcomes: On successful completion of this course unit students will be able to:
CO1:Master the basic concepts of some special functions.
CO2: List some properties of Riemann–Liouville fractional derivative and integral.
CO3: Define Caputo and Grunwald–Letnikov Operators.
CO4: Recognize some new nonclassical definitions of fractional derivatives and integrals.
CO5: Find Laplace transform of fractional derivatives.

Catalog Description

The course introduces basic concepts of fractional calculus and the concepts associated Special Functions of the Fraction Calculus, Riemann–Liouville Differential and Integral Operators, Grunwald– Letnikov Operators, Definition and Bas Properties of Caputo Fractional Derivative, Mittag-Leffler Functions, Existence and Uniqueness of Fractional Different Equations (FDEs), Exact and Numerical Solution of FDEs, Nonclassical Definitions of Fractional Derivatives and Integra

Manesar Gurgaon-122413

Module I Gamma Function: Definition of the Gamma function, Some properties of the Gammafunction, Limit Representation of the Gamma function, BetaFunction, Contour Integral Representation, Contour Integral Representation of $\frac{1}{\Gamma(z)}$. Mittag-Leffler Function: Definition and Relation to some other functions, The Laplace transformation of the Mittag-Leffler Function in two parameters, Derivative of the Mittag-Leffler Function, Differential Equations for the Mittag-Leffler Function, Summation Formulas, Integration of the Mittag-Leffler function.	L1, L2, L3, L4, L6	10
Module-II: GrunwaldLetnikov Fractional derivatives: Unification of Integer-order Derivativesand integrals, Integrals of Arbitrary Order, Derivatives of Arbitrary order, Fractional Derivativeof Composition with integer-order Derivatives, Composition with Fractional Derivatives.consequences. Normed Spaces of Operators. Dual S.	L1, L2, L3, L4, L6	12
Module-III: Riemann Liouville Fractional Derivatives: Unification of integral-order Derivatives and Integrals,Integrals of ArbitraryOrder, Derivatives of Arbitrary Order Composition with Integer-Order Derivatives, Composition with Fractional Derivatives, Link oftheGrtunwald-letnikov Approach, Caputo's Fractional Derivative, Generalized Functions Approach, Sequential Fractional Derivatives, Leftand Right Fractional Derivatives.	L1, L2, L3, L4, L6	14
Module-IV: Properties of fractional Derivatives:Linearity, The Leibniz Rule for Fractional Derivatives,Fractional Derivative of a CompositeFunction, Riemann Liouville fractional Differentiation of anIntegral depending on a Parameter, Behaviour near the Lower terminal, Behaviour far from the Lower terminal.	L1, L2, L3, L4, L6, L5	12

DMTH2803	FLUID DYNAMICS	L	T	P	C
Version 1.1	Date of Approval: 2012	3	1	0	4
Pre-requisites/Exposure	Basic Knowledge of Vector Calculus				
Co-requisites					

Course Description

The course of fluid dynamics is an interdisciplinary and widely used by scientist as well as engineers.

Course Objectives

- Fluids have the ability to transport matter and its properties as well as transmit force.
- Develop fundamental knowledge and understanding of the mechanics of fluid both at rest and in motion.

Course Outcomes

On completion of this course, the students will be able to

CO1. Describe Concept of fluid and its physical properties

CO2. Explain General theory of stress for Newtonian Fluid

CO3. Discuss the velocity potential, Irrotational flow, Some theorems about rotational and irrotational flows, Stoketheorem, Kelvin's minimum energy theorem, Gauss theorem, Kelvin's circulation theorem.

CO4. Discuss Incompressible viscous fluid flows

Course Content

Modules	Blooms level*	Number of hours
Module-I Definition: Fluid, Fluid Dynamics, Stress (shear stress and normal stress), strain, viscosity (dynamic and kinematic). Variation of viscosity with temperature for liquids and gases. Continuum hypothesis, No-slip boundary condition, application areas of fluid dynamics. Kinematics: Different types of forces: Viscous and inertial forcesSome common non-dimensional parameters and their physical significance: Reynolds number, Froude number and Mach number.	L1, L2, L3	10
Module-II: Newton's law of viscosity, Classification of fluids:	L1, L2,	12

Newtonian and Non-Newtonian fluid, compressible and incompressible fluid. Inviscid , ideal and real fluid. Different types of flow: Uniform and non-uniform, steady and unsteady, rotational and irrotational flow, Laminar, Turbulent and Transient flow. Flow description: Eulerian and Lagrangian description of fluid motion. Fluid element trajectories: Streamline, pathline, streakline, timeline.	L3	
Module-III: Introduction to Tensors: Definition, rank of tensor, Einstein notation or indical notation, free and dummy indices. Vector operations and calculus operations using index notation (Einstein notation). Cauchy stress tensor, deviatoric stress tensor, volumetric stress tensor. Deformation of fluid-elements: derivation of rate of translation vector, rate of rotation, vorticity vector, linear strain rate, strain rate tensor, deformation tensor.	L1, L2,L3	14
Module-IV: Bernoulli's equation - assumptions and applications. Differential Analysis: Differential equations of mass and momentum for incompressible flows: inviscid - Euler equation and viscous flows - Navier-Stokes equations, concept of fluid rotation, vorticity, stream function, Exact solutions of Navier-Stokes equation for Couette Flow and Poiseuille flow.	L1, L2, L3, L4	12

DMTH2804	**FUNCTIONAL ANALYSIS**	L	T	P	C
Version	Date of Approval:2017	3	1	0	4
Pre-requisites/Exposure	Metric space ,normed space, vector space.				
Co-requisites	None				

Catalog Description

The course introduces basic concepts of functional analysis and the concepts associated with the dual of a linear spaceStudent will learn the basic properties of norm (Banach) and inner product (Hilbert) spaces as well as fundamentals linear operator theory. They will also develop an understanding to use these concepts in various mathematical application in pure mathematics such as representation theory

Course Outcomes:

On successful completion of this course unit students will be able to:

CO1. Explain basic concepts and results in functional analysis.

CO2. Describe duality in various contexts and theoretical results from the course in concrete situations and theapplications appearing

CO3. Compute examples and counterexamples illustrating the mathematical concepts presented in the course.

CO4. Solve an important theorems and be able to explain the key steps in proofs, sometimes with variation and develop skills in applying the techniques of the course to unseen situations.

DMTH2806	**NUMERICAL SOLUTIONS TO DIFFERENTIAL EQUATIONS**	L	T	P	C
Version	Date of Approval: 2017	3	1	0	4
Pre-requisites/Exposure	Basic Numerical Analysis				
Co-requisites					

Catalog Description: The problems in Numerical solution of equations are the most important and common application ofMathematics. The main aim of this course is to present different methods of solving ordinary and partial differential equations like, linear and non linear differential equations, heat equation, Laplace equation using Numerical methods anMATLAB. In addition to the theoretical treatments, there will be some introduction to numerical methods by using MATLAB.

Course Objectives:
The course covers few classical and contemporary methods for solving initial and boundary value problems. Different finite difference operators and their application to solve various types of Partial Differential Equationsshall be introduced in the course.

Course Outcomes:
On successful completion of this course unit students will be able to:
CO1. Illustrate the concept of solution of Linear & Non-linear equations using Numerical methods.
CO2. Describe the concept of solution of ordinary differential equations by different numerical methods.
CO3. Explain the concept of using MATLAB for solving different equations.
CO4. Compute the error approximations and solution of specific equations.

DMTH2805	TOPOLOGY	L	T	P	C
Version	Date of Approval:2017	3	1	0	4
Pre-requisites/Exposure	Basic Set theory				
Co-requisites	None				

Catalog Description

Topology is a modern branch of geometry. It serves to lay the strong foundations of concepts for study in analysis andgeometry. It is also a prerequisite for many concepts related to Analysis. The course is designed to develop understanding of topological ideas & techniques and their role in analysis.

Course Objectives:

Students will learn:

- The fundamentals of point-set topology and algebraic topology.
- Countability and separation axiom, compactness and connectedness.

Course Outcomes:

On successful completion of this course unit students will be able to:

CO1. Define and illustrate the concept of topological spaces and continuous functions,

CO2. Define and illustrate the concept of product topology and quotient topology, connectedness and compactneand prove a selection of related theorems.

CO3. Explain theorems concerning topological spaces, continuous functions, product topologies, and quotietopologies,

CO4. Describe the concepts of the separation axioms, connectedness and compactness.

Modules	Blooms level*	Number of hours
Module I: Definition and examples of topological space Base and sub base for a topology, Subspaces and relative topology, Closed sets, Neighbourhoods, interior, exterior, boundary, contact and limit points of sets, derived sets, dense sets and nowhere dense subsets. Alternate methods of defining a topologyin terms of Kuratowski Closure Operator and Neighborhood Systems, Homeomorphism:Definition and properties of continuous function, open functions, closed functions, Homeomorphisms uniform continuous functions. Product spaces:Box topology, weak topology, Tychonoff topology	L1, L2,L3	12

DMTH2807	NATURE INSPIRED OPTIMIZATION TECHNIQUES	L	T	P	C
Version		3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Objective:

The problems in optimization are the most common applications of mathematics. The main aim of this course is to solve different types of optimization problems using algorithms that are inspired by naturally occurring phenomena. This will be done primarily through the knowledge of evolutionary computation and swarm intelligence.

Natural Computation is the study of computational systems that use ideas and get inspiration from a variety of natural systems. Describe different nature-inspired search and optimization methods and explain how they are applied to solve real world problems.

Course Outcome:

- Understand the need of optimization and its different types.
- Understand the working of Nature inspired algorithm.
- Understand and implement classic and nature inspired optimization algorithms.
- Evaluate the performance of algorithm by implementing it.

Course Contents:

Module I:

Introduction to Algorithms and Optimization Introduction to algorithm, fundamental of Optimization, Types of optimization problems, example of optimization, formulation of optimization problem and classification of optimization algorithm, Classical optimization algorithm like graphical, simplex method, Overview of dynamical and integer programming. applications of nature inspired optimization algorithm. Travelling salesman Problem

Module II: Introduction to Metaheuristic and Evolutionary algorithm

Difficulty with classical optimization problem, Metaheuristic algorithm, Single solution-based metaheuristics, Population based metaheuristic, Evolutionary algorithm,

Module III: Optimization Schemes

Basics of Particle Swarm optimization (PSO), Basics of Genetic Algorithm, example of PSO and GA. Application of different optimization algorithms.

Module IV: Case studies

Unimodal Benchmark Function, Multimodal Benchmark function, Application of GA and PSOon real life problems like welded beam problem, spring design problem, pressure vessel problem

DMTH2839	DATA ANALYSIS & VISUALISATION USING SOFTWARE	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	Class X Mathematics				
Co-requisites					

Catalog Description

The implosion of available data has made visualization more critical but also more challenging. Data analysis and Data Visualization are essential tools for business analysis, engineers, policymakers, and decision-makers. Developed originally for "small data", visualization techniques have been met with varied success in the past centuries and decades. There are a few well-known visualizations that are very effective in capturing the essence of the data, and of course, there are many infamous negative examples of poor visuals. An effective visual is critical for decision making it, but it also requires a lot of work, customization, attention to detail, and refinements.

Course Objectives

The course is designed to help students develop skills and knowledge in the following area(s):

- Develop an understanding of what is a good visualization for a given purpose
- Learn visualization theory & techniques
- Build a substantial data analytic project
- Apply data analysis and visualization with Excel, SPSS, R, Python, NVivo and MATLAB

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will be able to articulate meaningful lines of inquiry that might be explored through the collection, organization, visualization, and analysis of data in a context associated with their primary field of study using (as appropriate) numerical, textual, spatial, and/ or visual data.

CO2. Student will understand what data are, how they are collected, and how to assess the quality/ reliability of data.

CO3. Students will demonstrate intermediate proficiency in the visualization of data to communicate information and patterns that exist in the data.

CO4: Students will be able to use at beginning level of proficiency the tools of statistics and machine learning to ask questions of and explore patterns in data.

Course Content :

Module	Topics Covered	Blooms Level	Contact Hours
1	**Module-1: Introduction to Excel** Data Analysis using Excel, Curve fitting, Correlation, Linear Regression, Multiple regression, Principal Component Analysis and Factor Analysis, Hypothesis testing	L1, L2, L3, L4	20 hours

NMTH2837	Research Project	L	T	P	C
Version 1.1	Date of Approval: 2017	0	0	0	12
Pre-requisites/Exposure	Basic mathematical knowledge, presentation and writing skills				
Co-requisites					

Course Description

This course deals with both the theoretical and practical aspects of designing dissertation research and successfully defending the design in a proposal hearing. The purpose of the course is to assist studentsthrough the proposal and dissertation writing processes.

Course Objectives

The objective of this course is to:

- Training of students as an independents researcher before entering academics or industries.
- Develop interest for genuine exploration of the unknown that leads to new knowledge whichoften warrants publication.
- Provide exposure of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation.

Course Outcomes

On completion of this course, the students will be able to

CO1. Recognize independent skills of critical investigation

CO2. Explain the problem systematically. They will able to relate problem with available methodologies and evidence.

CO3. Determine appropriate techniques and draw concluding remarks.

CO4. Describe and communicate research concepts and contexts clearly and effectively both in writing and orally.

GUIDELINES FOR PROJECT FILE AND PROJECT REPORT Research experience is as close to a professional problem-solving activity as anything in the curriculum. It provides exposure toresearch methodology and an opportunity to work closely with a faculty guide. It usually requires the use of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation. Research is genuine exploration of the unknown that leads to new knowledge which often warrants publication. But whether or not the results of a research project are publishable, the project should be communicated in the form of a research report written by the student. Sufficient time should be allowed for satisfactory completionof reports, taking into account that initial drafts should be critically analyzed by the faculty guide and corrected by the student at each stage. **PROJECT FILE** The Project File may be a very useful tool for undertaking an assignment along-with a normal semester, an exploratory study, sponsored projects, a project undertaken during summer period or any other period as per curriculae where the researcher is working with a company/organization. The project/ assignment may also bea part of the bigger research agenda being pursued by a faculty/ institution/ department The Project File is the principal means by which the work carriedout will be assessed and therefore great care should be taken in itspreparation. This file may be considered in continuous assessment. In general, the File should be comprehensive and include: **PROJECT REPORT** The Project Report is the final research report that the student prepares on the project assigned to him. In case of sponsored project the layout of the project could be as prescribed by the sponsoring organization. However, in other cases the following components should be included in the project report:	L2,L4,L5,L6	NTCC

Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

• **Title or Cover Page**
  o The title page should contain Project Title; Students Name; Programme; Year and Semester and Name of the Faculty Guide.
• **Acknowledgement(s)**
  o Acknowledgment to any advisory or financial assistance received in the course of work may begiven. It is incomplete without student's signature.
• **Abstract**
  o A good "Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard tothe objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project. It should not exceed more than 1000 words.
• **Table of Contents**
• Titles and subtitles are to correspond exactly with those in the text.
• **Introduction**
  o Here a brief introduction to the problem that is centralto the project and an outline of the structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided.
• **Materials and Methods**
  o This section should aim at experimental designs, materials used (wherever applicable). Methodology should be mentioned in details including modifications undertaken, if any. It includes organization site(s), sample, instruments used with itsvalidation, procedures followed and precautions.
• **Results and Discussion**
  o Present results, discuss and compare these with those from other workers, etc. In writing this section, emphasis should be laid on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in text books. Avoid abrupt changes in contents from sectionto section and maintain a lucid flow throughout the thesis. An opening and closing paragraph in every chapter could be included to aid in smooth flow.		

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Note that in writing the various sections, all figures andtables should as far as possible be next to the associated text,in the same orientation as the main text, numbered, andgiven appropriate titles or captions. All major equations should also be numbered and unless it is really necessary, do not write in "point" form.

While presenting the results, write at length about the various statistical tools used in the data interpretation. The result interpretation should be simple but full of data and statistical analysis. This data interpretation should be in congruence with the written objectives and the inferences should be drawn on data and not on impression. Avoid writing straight forward conclusion rather; it should lead to generalization of data on the chosen sample.

Results and its discussion should be supporting/contradictingwith the previous research work in the given area. Usually one should not use more than two researches in either case ofsupporting or contradicting the present case of research.

- **Conclusion(s) &Recommendations**

  A conclusion should be the final section in which the outcome of the work is mentionedbriefly. Check that your work answers the following questions:

  Did the research project meet its aims (check back to introductionfor stated aims)?

  What are the main findings of the research?Are there any recommendations?

  Do you have any conclusion on the research process itself?

- **Implications for Future Research**

  This should bring out further prospects for the study either thrown open by the present work or with the purpose of making it more comprehensive.

- **Appendices**

  The Appendices contain material which is of interest to the reader but not an integral part of the thesis and any problem that have arisen that may be useful to document for future reference.

- **References**

References should include papers, books etc. referred to in the body of the

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

report. These should be written in the alphabetical order of the author's surname. The titles of journals preferably should not beabbreviated; if they are, abbreviations must comply with an internationally recognized • **The Layout Guidelines for the Project File & Project Report:** A4 size Paper Font: Arial (10 points) or Times New Roman (12points) • Line spacing: 1.5 • Top and bottom margins: 1 inch/ 2.5 cm; left and right margins: 1.25 inches/ 3cm **ASSESSMENT OF THE PROJECT FILE AND THE PROJECT REPORT** Essentially, the assessment will be based on the quality of the report, the technical merit of the project and the project execution. Technical merit attempts to assess the quality and depth of the intellectual efforts put into the project. Projectexecution is concerned with assessing how much work has been put in. The Project should fulfill the following *assessment to objectives:* • Range of Research Methods used to obtaining formation • Execution of Research • Data Analysis (Analyze Quantitative/ Qualitative information) • Quality Control • Conclusions		

Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

SEMESTER-I

MECHANICS

Course Code: DPHY2151 **Credit Units: 03**

Course Objective:
This course has been so framed that the students are exposed to the topics of conservation laws, dynamics of rigid bodies and inverse-square law of forces in the framework of Newtonian Mechanics. Fluid Mechanics (Surface Tension and viscosity) and elasticity are also included here.

Course Contents:

Module I: Conservation Laws
Coordinate systems and motion of a particle, velocity, and acceleration in Cartesian and Spherical coordinate systems, Solid angle. Frames of reference, Inertial and non-inertial frames, Space-Time Symmetry, Work-Energy Theorem, Conservative and nonconservative forces, Force as a gradient of potential energy, Conservation Laws: Relationship of conservation laws and symmetries of space and time.

Module II: Elastic and Inelastic Scattering
Types of scattering and conservation laws, Laboratory and center of mass systems, the collision of particles that stick together, and General elastic collision of particles of different masses.

Module III: Inverse-Square-Law of Forces
Central and non-central forces, Inverse square force, Centre of mass. Two-body problem – reduced mass, angular momentum in a central force field, Moment of inertia. Flywheel, Theory of compound pendulum and determination of g. Equation of motion under a force law, Newton's Law of Gravitation, Various forces in nature (qualitative)., Orbits and their eccentricity, Kepler's laws., The motion of Geo-synchronous and geostationary satellites, The basic idea of the global positioning system (GPS)

Module IV: Elasticity
Hooke's Law Stress - Strain Diagram - Elastic moduli - Relation between elastic constants - Poisson's Ratio - Expressions for Poisson's ratio in terms of elastic constants - Work done in stretching and twisting a wire - Twisting couple on a cylinder- Rigidity modulus by static torsion - Torsional pendulum - Rigidity modulus and moment of inertia. Cantilever - Expression for bending moment - Expression for depression - Cantilever oscillations - Expression for the time period - Experiment to find Young's modulus - Non-uniform bending - - Uniform bending - Expression for elevation.

Module V: Elementary Fluids Dynamics:
Surface Tension: Definition and dimensions of surface tension - Excess of pressure over curved surfaces - Application to spherical and cylindrical drops and bubbles. *Viscosity*: Co-efficient of viscosity and its dimensions - Rate of flow of liquid in a capillary tube - Poiseuille's' formula, Variation of viscosity of a liquid with temperature - Applications of viscosity. *Fluids* and their properties, Basic kinematics of moving fluids. Ideal fluid in motion, Equation of continuity, Bernoulli's Theorem, The flow of real fluids

DEMONSTRATIVE ASPECTS IN MECHANICS

Course Code: DPHY2152 **Credit Units: 01**

LIST OF EXPERIMENTS

Measure length (or diameter) using a Vernier caliper, screw gauge, and traveling microscope.
To determine the Moment of Inertia of a Flywheel.
To determine the value of acceleration due to gravity, g using a Bar Pendulum.
To determine the Coefficient of the Viscosity of water by the Capillary Flow Method (Poiseuille's method).
To determine the elastic Constants of a wire by Searle's method.
To determine the height of a building using a Sextant.
To determine the value of acceleration due to gravity in the laboratory using the Kater pendulum.

MATHEMATICAL PHYSICS-I

Course Code DPHY2101 **Credit Units: 04**

Course Objectives

This course aims at exposing the students to basic Mathematics which will be useful for them to solve the problems of Physics.

Course Contents:

Module 1 Vector Calculus

Dot and cross product of vectors, Gradient, divergence, and curl, their physical significance, Laplacian, vector identities, Line integral, surface integral and volume integral, Gauss divergence theorem, Stokes theorem.

Module 2 Orthogonal curvilinear coordinates

Orthogonal curvilinear coordinates, line element, gradient, divergence and curl in curvilinear coordinates, Cartesian coordinate system, Polar coordinates, Cylindrical coordinate system, Spherical polar coordinate system.

Module 3 Fourier Series

Periodic functions, Fourier series, Euler‟ 's formulae, Even functions, Half range series, Change of interval and functions having an arbitrary period, Summing of Infinite Series: Parseval Identity, practical harmonics analysis.

Module 4 Special integrals

Beta and Gamma Functions and the Relation between them. Expression of Integrals in Terms of Gamma Functions.

Module 5 Partial Differential Equations

Solutions to partial differential equations, using separation of variables: Laplace's Equation in problems of rectangular geometry. Solution of the wave equation for vibrational modes of a stretched string, rectangular and circularmembranes. Solution of 1D heat flow equation (equation not to be derived).

SEMESTER-II

THERMODYNAMICS

Course Code: DPHY2251 **Credit Units: 03**

Course Objective:
This course aims to expose the students to the basic laws of thermodynamics and its applications in everyday life.

Course Contents:

Module I: Kinetic Theory
Postulates of Kinetic theory of gases; Pressure exerted by ideal gas; Deduction of Boyle's law, Charles law, Avogadro's hypothesis; Degree of freedom; Law of equipartition of energy; Brownian motion; Specific heat; Relation between Specific heat and degrees of freedom; Specific heat of mono, di, polyatomic gas; Critical constants for a gas; Van der Waals equation of state; Estimation of critical constants and critical coefficient; Reduced equation of state; Mean free path and its derivation, Sphere of influence, Collision cross section; Elementary treatment of transport phenomena.

Module II: Laws of Thermodynamics
Zeroth law of thermodynamics, concept of temperature, Absolute temperature. Thermodynamic processes (isothermal, adiabatic, and isobaric), P-V diagram, and Work done in a thermodynamic process. Ist law of thermodynamics, Reversible and irreversible processes, Examples irreversibility, Carnot's cycle, and Carnot's theorem. The second law of thermodynamics, various statements of the second law, Concept of Entropy, Entropy change in reversible and irreversible processes. Entropy and disorder, Principle of increase of entropy, Entropy and unavailable energy, Entropy of ideal gases, Entropy as a thermodynamic variable, S-T diagram, Maxwell's relations.

Module III: Low Temperature
The third law of thermodynamics, Nernst heat theorem. Cooling produced by adiabatic stretching, adiabatic compression, Liquefaction of gases by Joule-Thomson expansion: thermodynamic analysis, Production of low temperature by adiabatic demagnetization, First order phase transitions: Clausius-Clapeyron equation, Phase transition, Coexistence of phases, Triple point.

Module IV: Transmission of Heat
Modes of heat transmission, Conduction in solids: Lee's disc method, Convection of heat. Radiation: Black body, Black body radiation, Stefan-Boltzmann law, Stefan's constant, Newton's law of cooling, Kirchhoff's law of thermal radiation, solar constant, temperature of the Sun, solar spectrum, distribution of energy in the spectrum of a black body, Planck's quantum theory of radiation (qualitative)

DEMONSTRATIVE ASPECTS IN THERMODYNAMICS

Course Code: DPHY2252 **Credit Units: 1**

List of Experiments to be performed in Lab Aligned to Thermodynamics

To determine the thermal conductivity of a bad conductor (glass) in the form of a disc using Lee's method.
To determine the Coefficient of Thermal Conductivity of Copper by Searle's apparatus.
To study the variation of Thermo-Emf of a Thermocouple with Difference of temperature of its Two Junctions.

In addition, some of the experiments that can be taken into consideration during the lab are

To determine the Stefan's constant
To determine the Rydberg's constant

ELECTRICITY & MAGNETISM

Course Code: DPHY2201 **Credit Units: 04**

Course Objective:
This course aims to teach the students basics of electronics and electric current after making them comfortable with the mathematical tools involved in the study of electricity and magnetism.

Course Contents:

Module-I: Static Electric Fields and Potential
Coulomb's Law, Electric Field, Electric Flux, Gauss's law, Electric Field for Spherical, Plane and Cylindrical Distribution of Charges (applications of Gauss law), Differential form of Gauss's Law; Electric Potential; Potential for Charge Distributions: Equipotential Surfaces, Potential due to Charged Wire and Charged Disc, Energy Associated with Electric Field; Divergence and Curl of Electrostatic Field, Scalar Potential, Poisson's and Laplace equation in Cartesian Coordinates,

Module-II: Electric Fields in Materials:
Review of capacitors, Dielectric Material in an Electric Field, Polarization, Gauss's Law in Dielectric Medium, relation between D, E and P, Displacement Vector, Boundary Conditions on D and E; Dielectric Material between Capacitor Plates, Energy stored in a capacitor having dielectric medium.

Module-III: Electric current and its magnetic effects:
Electric Currents: Charge Transport and Current Density, Equation of Continuity, Ohm's Law in vector form.
Magnetic Field: Divergence of Magnetic Field, Ampere's Law and its Applications to Straight Wire, Solenoid and Toroid; Force on a Charged Particle Moving in Electric and Magnetic Fields, Current Loop and Magnetic Dipoles, Magnetic Dipole Moment. Magnetization; Diamagnetic, Paramagnetic and Ferromagnetic materials; Field of a magnetized Object; bound current; Ampere's law in Magnetized materials.

Module-IV: Basic of Electromagnetism
Faraday's Laws of Electromagnetic Induction, Lenz's Law, Self and Mutual Inductance, Self Inductance for Solenoid, Mutual Inductance of Coupled Solenoids, Energy Stored in the Magnetic Field; Transformer as an application of EMI. Static and time varying field, Ampere's circuital law, Maxwell's equations, significance and applications.

SEMESTER-III
WAVES AND OPTICS

Course Code: DPHY2351 **Credit Units: 03**

Course Overview: Simple Harmonic Motion, Damped Harmonic Motion, Forced Harmonic Motion, Interference by division of amplitude and division of wavefront, Single slit, and N-slit diffraction, Polarization by reflection and double refraction, Nicol prism, Laser, fiber optics.

Course Contents:

Module I: Free and Forced Oscillations

Simple Harmonic Motion: Simple Harmonic Motion and its differential equation. Energy of SHO, amplitude and frequency of SHM. Mechanical simple harmonic oscillator: Mass suspended to spring (Horizontal and vertical vibrations). Damped Harmonic Motion: Damped oscillations, derivation of decaying amplitude. Discussion of three cases viz; over damping, critical damping and under damping. Power dissipation, relaxation time, quality factor. Forced Harmonic Oscillations: Resonance, mathematical formulation of FHO, amplitude resonance, resonant driving frequency, sharpness of resonance. Power absorbed by a forced oscillator, bandwidth of resonance, quality factor of FHO. Standing and progressive waves.

Module II: Interference

Spatial and temporal coherence. Division of wavefront (Fresnel's Biprism). Division of amplitude (Newton's Rings). Michelson Interferometer. High reflection, and antireflection coatings.

Module III: Diffraction

Types of Diffraction, Fraunhofer diffraction by a single slit. Fraunhofer diffraction by N- Slits, Grating spectra, Absent spectra. Dispersive power and Resolving Power of grating.

Module IV: Polarization

Polarization by refraction and reflection. Double refraction, Nicol prism, Quarter and half wave plates, Polarimetry; Optical and specific rotation, Laurent's half shade polarimeter, Applications of polarization.

Module V: Laser and Fiber Optics

Spontaneous and stimulated emission, Einstein Coefficients, Laser action, Characteristics of laser beam, Types of lasers, He-Ne laser, Laser applications (Manufacturing, medical, metrology, communication, data storage etc.) Concept of optical fibers, Propagation of light in optical fiber, Numerical Aperture, Types of fibers (single and multimode), V-number, Attenuation, and dispersion in fibers

DEMONSTRATIVE ASPECTS IN WAVES AND OPTICS

Course Code: DPHY2352 **Credit Units: 01**

Course Objective:
The objective of the course is to enable students to understand the aspects of Optics and Waves. This will enable students to demonstrate the conceptual knowledge through various experiments in Laboratory.

Course Contents:
List of Experiments to be performed in Lab
To determine the wavelength of sodium light by Newton's ring apparatus.
To determine the dispersive power of material of prism with the help of spectrometer.
To determine the specific rotation of sugar solution by Bi-quartz or Laurent half shade polarimeter.
To determine the wavelength of prominent spectral lines of mercury by plane diffraction grating in first and second order spectrum.
To determine the wavelength of He-Ne laser light using single slit.
To determine the frequency of an electrically maintained tuning fork by Melde's method.
To determine the frequency of AC mains using sonometer.

CLASSICAL MECHANICS

Course Code: DPHY2301 **Credit Units: 02**

Course Objective:
This course aims at exposing the students to let them understand the basics of Classical Mechanics

Course Contents:

Module I: Lagrangian formulation of classical mechanics
Mechanics of a system of particles; constraints & degrees of freedom, Generalised coordinates, momentum, force & energy. D' Alembart's principle; variational technique; Hamilton's variational principle; Lagrange's equation for conservative systems and its application to simple cases: simple and spherical pendulum, one dimensional and isotropic oscillator etc.

Module II: Hamiltonian formulation of classical mechanics and old quantum theory
Hamilton's canonical equations of motion; Idea of cyclic coordinates, its relation with conservation principles, applications of Hamiltonian formulation to simple cases, Variational principle and least action; contact transformations; poisson bracket; Hamilton Jacoby theory.

Module III: Mechanics problems using the Lagrangian formulation
Central force problem: Two body problem; reduced mass; motion under central force; constants of motion; Virial theorem; Kepler's laws of planetary motion.
Rigid body dynamics: moment of inertia, Angular momentum and kinetic energy of motion about a point; introduction about tensors

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

STATISTICAL MECHANICS

Course Code: DPHY2302 **Credit Units: 02**

Course Objective:
This course introduces assumptions, principles and practices of statistical mechanics.

Course Contents:
Module I: Thermodynamics in connection to statistical mechanics
Contact between statistics and thermodynamics, Thermodynamic equilibrium, and Thermodynamic potentials. Entropy and thermodynamic probability, Classical entropy expression, Gibbs paradox, the entropy of mixing, correct Boltzmann's counting, law of equipartition of energy, applications to specific heat and its limitations.

Module II: Classical and Quantum Theory of Radiation:
Elements of ensemble theory, micro-canonical, canonical and grand canonical ensemble, partition function, fluctuations, Planck's law of black body radiation, deduction of Wien's radiation formula, Rayleigh-Jeans law, Stefan-Boltzmann law and Wien's displacement law from Planck's law,

Module III: Bose-Einstein Statistics
B-E distribution law, B-E condensate, difference between B-E condensation and normal condensation, thermodynamic functions of an ideal weakly degenerate gas, , Bose-Einstein condensation properties of liquid He (qualitative description)

Module IV: Fermi- Dirac Statistics
Fermi-Dirac distribution law, Fermi energy, Fermi Temperature, thermodynamic functions of an ideal weakly degenerate Fermi gas, electron gas in a metal, white dwarf stars (qualitative description), Chandrasekhar mass limit(qualitative description)

Examination Scheme:

FUNDAMENTALS OF C PROGRAMMING

Course Code: SPHY2301 **Credit Units: 02**

Course Objective:

The objective of this course module is to acquaint the students with the basics of computers system, its components, data representation inside computer and to get them familiar with various important features of procedure oriented programming language i.e. C.

Course Contents:

Module I: Introduction

Introduction to computer, history, von-Neumann architecture, memory system (hierarchy, characteristics and types), H/W concepts (I/O Devices), S/W concepts (System S/W & Application S/W, utilities). Data Representation: Number systems, character representation codes, Binary, octal, hexadecimal and their interconversions. Binary arithmetic, floating point arithmetic, signed and unsigned numbers, Memory storage unit.

Module II: Programming in C

History of C, Introduction of C, Basic structure of C program, Concept of variables, constants and data types in C, Operators and expressions: Introduction, arithmetic, relational, Logical, Assignment, Increment and decrement operator, Conditional, bitwise operators, Expressions, Operator precedence and associativity. Managing Input and output Operation, formatting I/O.

Module III: Fundamental Features in C

C Statements, conditional executing using if, else, nesting of if, switch and break Concepts of loops, example of loops in C using for, while and do-while, continue and break. Storage types (automatic, register etc.), predefined processor, Command Line Argument.

Module IV: Arrays and Functions

One dimensional arrays and example of iterative programs using arrays, 2-D arrays Use in matrix computations .Concept of Sub-programming, functions Example of user defined functions. Function prototype, Return values and their types, calling function, function argument, function with variable number of argument, recursion.

Module V: Advanced features in C

Pointers, relationship between arrays and pointers Argument passing using pointers, Array of pointers. Passing arrays as arguments. Strings and C string library. Structure and Union. Defining C structures, Giving values to members, Array of structure, Nested structure, passing strings as arguments. File Handling.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

SEMESTER-IV

BASICS OF ELECTRONICS

Course Code: DPHY2451 **Credit Units: 03**

Course Objective:
This course aims at exposing the students to Semiconductors, to give concepts of Electronics which are useful for research and industrial application.

Course Contents:

Module I: Junction Diodes and their Applications
P, N semiconductor, Formation of PN junction, Depletion region, Junction capacitance Transition and diffusion capacitance, Energy level diagrams and built in potential, diffusion and drift velocity of carriers, Diode equation, V-I characteristics, temperature dependence,
Applications Half-wave Rectifiers & Full-wave Rectifiers, Calculation of Ripple Factor and Rectification Efficiency. Low pass filter and High pass filter, Qualitative idea of C, L and π - Filters. Zener Diode and Voltage Regulation. Clipper, Tunnel Diode, Clamper, Varactor Diode, AC and DC Power Supplies

Module II: Circuit Analysis
Kirchhoff's Laws (KCL and KVL), Mesh and Node analysis of dc and ac Circuits, Superposition theorem, Thevenin's and Norton's theorem, reciprocity theorem, Linear resistive 2- ports and interconnections, Z, Y, L, S,T, H' and H" representations/Parameters,

Module III: Transistors
PNP and NPN junction transistors, transistor current components, CB, CC and CE Configurations, transfer characteristics, Transistor as switch and applications, Transistor biasing, fixed bias, emitter-stabilised biasing, Voltage-divider biasing, Field Effect Transistor (JFET), JFET V-I Characteristics, Application of FET as voltage variable resistor. Advantages of FET over BJT. MOSFET: construction, working & Application.

Module-IV: Operational Amplifiers: Differential amplifier-circuit configurations, Positive and negative feedback, CMRR. Operational amplifier: characteristics, frequency response, slew rate. Inverting and non-inverting amplifiers, Applications: Op-amp as Adder, subtractor, integrator, differentiator, Schmitt trigger amplifiers, current to voltage and voltage to current conversion, Voltage follower.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

DEMONSTRATIVE ASPECTS IN ELECTRONICS

Course Code: DPHY2452 **Credit Units: 01**

Course Objective:
The objective of the course is to enable students to understand the aspects of Electronics. This will enable students to demonstrate conceptual knowledge through various experiments in Laboratory.

Course Contents: List of Experiments to be performed in Lab
To investigate the use of an op-amp as an Integrator.
To investigate the use of an op-amp as a Differentiator.
To study Amplitude Modulation using Transistor.
To study Pulse Width / Pulse Position and Pulse Amplitude Modulation using ICs.
To verify the basic logic gates using logic gate trainer kit.
To design and verify the following digital circuits using basic gates:
S-R flip-flops, ii) J-K flip-flops.

Examination Scheme:

QUANTUM MECHANICS-I

Course Code: DPHY2401 **Credit Units: 04**

Course Objective: This course aims to expose the students to Quantum Mechanics and its applications in Physics.

Course Contents:

Module I: Failure of Classical Mechanics and Origin of Quantum Mechanics

Limitations of Classical Physics, Particle properties of waves: Black Body Radiation and Planck's Quantum hypothesis, Photoelectric effect, Compton Effect, Wave properties of particles: De-Broglie waves, physically acceptable wave functions, Probabilistic interpretation, Wave equation, phase and group velocity, Particle diffraction, Davisson and Germer experiment, Heisenberg uncertainty principle, Applications of uncertainty principle.

Module II: Time-dependent Schrodinger equation:

Time-dependent Schrodinger equation and dynamical evolution of a quantum state; Properties of Wave Function. Interpretation of Wave Function Probability and probability current densities in three dimensions; Conditions for Physical Acceptability of Wave Functions. Normalization. Linearity and Superposition Principles. Eigenvalues and Eigenfunctions. Position, momentum and Energy operators; commutator of position and momentum operators; Expectation values of position and momentum. Wave Function of a Free Particle.

Module III: Time-independent Schrodinger equation-

Hamiltonian, stationary states and energy eigenvalues; expansion of an arbitrary wavefunction as a linear combination of energy eigenfunctions; General solution of the time-dependent Schrodinger equation in terms of linear combinations of stationary states; Application to spread of Gaussian wave-packet for a free particle in one dimension; wave packets, Fourier transforms and momentum space wavefunction; Position-momentum uncertainty principle.

Module IV: Simple applications of Quantum Mechanics

Free particle, Particle in one dimensional and three dimensional box , Potential step. boundary conditions, bound and unbound states, Reflection and transmission coefficients for a rectangular barrier in one dimension, Tunnel effect, alpha decay, Linear harmonic oscillator (qualitative), The hydrogen atom problem (qualitative).

Examination Scheme:

INSTRUMENTATION PHYSICS

Course Code SPHY2401 **Credit Units: 03**

Course Objective:
This course aims at exposing the students to the instrumentation of some of the main experimental techniques used in Physics

Course Contents:
Module I: Error analysis and Vacuum technology
Description of error analysis, reporting and usage of uncertainties, Propagation of uncertainties, Error analysis: Instrumental and statistical uncertainties, propagation of errors, Estimation of Mean and Errors, Least Square Fitting, Calibration.
Introduction to Vacuum Systems, Kinetic Theory of Gases, Production of Vacuums, Vacuum Pumps – Rotary, Diffusion, Terbo-molecular, Pressure Measurement, Leak Detection, Specimen handling.

Module II: Instrumentation of Diffraction and Microscopic Techniques
X-ray Sources – Crookes Tubes, Coolidge Tubes, Filters, monochromator crystals, Multi-layered monochromators and mirrors, Detectors-Photographic film, Gas detectors, Solid detectors, Diffractometers-The Debye-Scherrer and Hull diffractometer, Bragg-Brentano diffractometers, An introduction to surface diffractometry.
Scanning Electron Microscope Instrumentation- Electron Beam Parameters, Electron. Optical Parameters-Beam Energy, Beam Diameter, Beam Current, Beam Solid Angle. SEM Imaging Modes- High Current Mode, Resolution Mode, Low Voltage Modes. TEM instrumentation, AFM instrumentation

Module III: Instrumentation of Spectroscopic Techniques
Gas Discharge Lamps, Spectral Lamps and Shapes of Spectral Lines-Low Pressure Spectral Lamps, Shape of Spectral Lines.
Optical Filters, Polarizers and Phase Plates. Monochromators – Prism Monochromator, Grating Monochromators

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

SEMESTER-V

MATHEMATICAL PHYSICS-II

Course code DPHY2501 **Credit Units: 04**

Course Objective:
The course introduces the students to the fundamentals of Complex numbers and complex variables, Fourier and Laplace transformation and partial differential equations.
This course aims at exposing the students to some part of Mathematics useful for them to solve typical problems of Physics.

Course Contents:
Module 1: Complex numbers
Complex numbers, Argand diagram, Modulus and argument, addition and multiplication, Exponential and circular functions of complex variables, De Movire's theorem, Real and imaginary parts of circular and hyperbolic functions, Logarithmic function of a complex variable.

Module 2 Integral transform
Fourier Transforms: Fourier Integral theorem(Statement only). Fourier Transform. Fourier sine and cosine transform, Fourier transform of derivatives, Inverse Fourier transform, Convolution theorem. Properties of Fourier transforms.

Module 3 Laplace transform
Laplace Transform (LT) of Elementary functions. Properties of LTs: Change of Scale Theorem, Shifting Theorem. LTs of 1st and 2nd order Derivatives and Integrals of Functions, Derivatives and Integrals of LTs. LT of Unit Step function, Periodic Functions. Convolution Theorem. Inverse LT. Application of Laplace Transforms to 2nd order Differential Equations

Module 4 Dirac delta function
Definition and properties. Representation of Dirac delta function as a Fourier Integral. Laplace and Fourier Transform of Dirac delta function

Module 5 Frobenius Method and special functions
Singular Points of Second Order Linear Differential Equations and their importance. Frobenius method and its applications to differential equations. Legendre, Bessel, Hermite and Laguerre Differential Equations. Properties of Legendre Polynomials: Rodrigues Formula, Generating Function, Orthogonality. Simple recurrence relations. Expansion of function in a series of Legendre Polynomials. Bessel Functions of the First Kind: Generating Function, simple recurrence relations. Zeros of Bessel Functions ($J_o(x)$ and $J_1(x)$) and Orthogonality

ATOMIC AND MOLECULAR PHYSICS

Course Code: DPHY2502 **Credit Units: 03**

Course Objective:
The aim of the course is to provide theoretical and practical knowledge on the many powerful methods provided by modern atomic- and molecular spectroscopy regarding basic studies as well as practical applications.

Course Contents:

Module I: Atomic Spectrum
Atomic structure, Hydrogen spectra, Bohr's model of one electron atom, Bohr-Sommerfield model, Good quantum numbers, Stern-Gerlach experiment and spin as an intrinsic quantum number. Incompatibility of spin with classical ideas. Fine structure. Study of fine structure by Michelson interferometer.

Module II: Vector atom model and many electron atoms
Magnetic moment of the electron, Landau's g factor. Vector model – space quantization. L-S and j-j coupling scheme, Spectroscopic terms of many electron atoms in the ground state, Zeeman effect and its explanation using vector atom model. Stark effect, selection rules for Zeeman and stark effect. L-S and j-j coupling-Interaction with electromagnetic radiation and with static fields.

Module III: Molecular Structure and Spectroscopy
Types of molecular spectra (Basics ideas), experimental study, Theory of pure rotational spectra, theory of rotational vibrational spectra, the Born-Oppenheimer approximation, Molecular rotations and vibrations, Molecular electronic transitions, Diatomic molecules–rotational and vibrational energy levels. Raman effect and its application to molecular spectroscopy (qualitative discussion). Molecular orbital theory.

Module IV: X-rays:
Production of X-rays, characteristic and continuous spectrum of X-rays, Mosley's law and its applications, difference between optical and X-ray spectra.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

DEMONSTRATIVE ASPECTS IN MODERN PHYSICS-I

Course Code: DPHY2503 **Credit Units: 01**

Course Objective:

The objective of the course is to enable students to understand the aspects of modern physics through experiments. This will enable students to demonstrate the conceptual knowledge through various experiments in Laboratory.

Course Contents: List of Experiments to be performed in Lab

To determine a Low Resistance by Carey Foster's Bridge.
To determine a Low Resistance by a Potentiometer.
To determine High Resistance by Leakage of a Capacitor.
To study the response curve of a Series LCR circuit and determine its (a) Resonant Frequency, (b) Impedance at Resonance and (c) Quality Factor Q, and (d) Band Width.
To study the response curve of a Parallel LCR circuit and determine its (a) Resonant Frequency and (b) Quality Factor Q.
To study (a) Half-wave Rectifier and (b) Full-wave Bridge Rectifier.
To study the Forward and Reverse characteristics of a Zener Diode and to study its use as a Voltage Regulator.
To study the CE Characteristics of a PNP Transistor.
To study the characteristics curves of PN junction diode in forward and reversed bias.
To study the Frequency Response of Voltage Gain of a RC-Coupled Amplifier.

RENEWABLE ENERGY RESOURCES

Course Code: DPHY2504 **Credit Units: 04**

Course Objective:
This is an introductory course to renewable energy technologies and potentials for Science and engineering students aiming to explain basic concepts of Renewable Energy resources.

Course Contents:

Module I: Energy & Thermodynamics & Environmental impact
Heat Transfer in Renewable Energy Systems - conduction, convection and radiation, thermal aspects of energy generation Work, heat, and the first law of thermodynamics. Heat engines and the second law of thermodynamics. The Carnot cycle. Applications of the second law to various energy transformation processes: heat pumps and refrigerators; different engine cycles. Use of fossil fuel, Energy crisis, Global Warming, Carbon emission and climate change. Need for sustainable development and Renewable Energy

Module II: Solar Energy (Thermal and Photovoltaic)
Solar energy option, Environmental impact of solar power, physics of the sun, Thermonuclear reactions, Black body radiation, Spectral distribution, the solar constant, radiation on titled surface / Earth, Solar Thermal Energy, Application of solar energy in Solar thermal and solar photovoltaic system, Brief introduction to generations of Solar cells

Module III: Ocean, tidal, wave energy
Principle of ocean thermal energy conversion (OTEC), setting of OTEC plants, thermodynamic cycles. Tidal and wave energy: Fundamentals of tidal power, Potential and conversion techniques, mini-hydel power plants. Use of tidal energy, Limitations of tidal energy conversion systems.

Module IV: Geothermal and Wind Energy
Structure of earth's interior, earthquakes & volcanoes, Geothermal resources, Hot springs, Steam ejection, Principal of working, Types of the geothermal station with schematic representation, Applications.
Properties of wind, Availability of wind energy in India, wind velocity, Wind machine fundamentals; types of wind machines and their characteristics, Horizontal and Vertical axis windmills, Elementary design principles, Coefficient of performance of a windmill rotor, Aerodynamic considerations in windmill design, Recent developments and applications

Module V: Hydrogen Energy and Biogas
Properties of hydrogen in respect of it's use as a source of renewable energy, Sources of hydrogen, Production of hydrogen; electrolysis of water, thermal decomposition of water, thermochemical production biochemical production. Storage Issues of Hydrogen, Applications of hydrogen energy. Biomass: Raw materials, Properties/ characteristics of biogas, Principles of Bio-Conversion; Photosynthesis, Anaerobic/aerobic digestion, types of Bio-gas digesters, gas yield, combustion, Transportation of biogas, biogas plant technology & status, Biomass cogeneration Energy recovery from urban waste, Power generation from liquid waste, and Biogas applications.

Examination Scheme:

NUMERICAL METHODS

Course Code: DPHY2505 **Credit Units: 04**

Course Objective:

This course is aimed to provide a fundamental understanding of Computer Oriented Numerical Analysis for students in their early stages of academic careers.Several concepts such as Solution of Linear Algebraic Equations, Solutions of Algebraic and Transcendental equations, Interpolation, Curve fitting, etc. will be introduced to students. After this course, you will be able to understand fundamental concepts of Numerical Analysis, which will prove highly beneficial to them in understanding more complicated topics of computer science.

Course Contents:

Module I: Introduction & Numerical Solution to ODE

Introduction to Numerical Analysis, Application Area of N.A., Basic Definition, Taylor Series Method, Euler's Method, Modified Euler's Method, Runga Kutta Method

Module II: Solution of Algebraic and Transcendental Equations

Introduction, Bisection Method, regular False Method, Iteration Method, Newton Raphson Method, Generalized Secant Raphson Method.

Module III: Interpolation and Curve Fitting

Basic Definition, Forward Differences, backward Differences, Central Differences, Newton Forward Differences Formula, Newton"s Divided Difference Formula, Lagrange's Method. Curve Fitting Techniques

Module IV: Numerical Differentiation & Integration

Numerical Differentiation based on Interpolation Formula, Numerical Integration, Trapezoidal Rules, Simpson's 1/3 rule, Simpson's 3/8 Rule

Module V: Statistical Computation

Frequency chart, Curve fitting by method of least squares, fitting of straight lines, polynomials, exponential curves etc, Data fitting with Cubic splines.

LASER AND FIBRE OPTICS

Course Code: DPHY2506 **Credit Units: 04**

Course Objective:
This course aims at students to give them basic understanding of Laser, Fibre Optics and their applications.

Course Contents:

Module I: Laser's Basics and components
Introduction, mono chromaticity, temporal and spatial coherence, Einstein's coefficients, possibility of light amplification, rate equations for two, three and four level systems, shape and width of spectral lines: line broadening mechanism, natural, collision and Doppler broadening.
Different methods of pumping, Resonators, modes of a resonator, number of modes per unit volume, open resonators, confocal resonator (qualitative), quality factor, losses inside the cavity, threshold condition, Laser pulsed output: Q switching, and mode-locking.

Module II: Types of Lasers
He-Ne laser, Nitrogen Laser, CO2 laser, Ruby laser, semiconductor lasers: intrinsic semiconductor lasers, doped semiconductors, condition for laser action, dye lasers.

Module III Optical Fiber Fundamentals
Historical development, Basic optics, Optical fiber wave guides Ray theory transmission, Total Internal Reflection, Acceptance angle, Numerical Aperture, Skew rays. Cylindrical fibers- Modes Fiber materials, Fiber fabrication techniques, Classification of Optical Fibers: Single mode fibers, Graded Index fibers

Module IV: Signal distortion in optical fibers Optical fiber Connectors:
Attenuation, Absorption, Scattering and Bending losses, Core and Cladding losses. Information capacity determination, Group delay, Types of Dispersion - Material dispersion, Wave-guide dispersion, Polarization mode dispersion, Intermodal dispersion, pulse broadening.
Connector types, Single mode fiber connectors, Connector return loss. Introduction to Optical Fibers splicing

Module V: Applications of Laser and Fibers
Holography, non-linear optics: harmonic generation, second harmonic generation, phase matching and optical mixing, brief qualitative description of some experiments of fundamental importance.
Fundamentals of Fiber Optical Communication Components and System

Examination Scheme:

SCIENTIFIC COMPUTING

Course Code: DPHY2507 **Credit Units: 04**

Course Objective: MATLAB is a scientific computing tool that can be used to solve many real-life problems coming from various areas of science and engineering. The course introduces the basics of MATLAB; how to effectively use a few commonly used built-in functions; hands-on experience of MATLAB programming and its applications to various practical problems.

Course Contents:

Module-I: Introduction to MATLAB: vector and matrix generation, subscripting and the colon notation, matrix and array operations and their manipulations, introduction to some inbuilt functions. m-files: scripts and functions, editing, saving m-files.

Module-II: Two & three-dimensional graphics: basic plots, change in axes and annotation in a figure, multiple plots in a figure, saving and printing figures, mesh plots, surface plots, and their variants.

Module-III: Relational and logical operators: flow control using various statements and loops including If-End statement, If-Else-End statement, nested If-Else-End statement, For-End and While-End loops with Break commands.

Module-IV: Applications of MATLAB: Solving a linear system of equations, calculus of polynomials using inbuilt functions, solving equations in one variable, solving ordinary differential equations using inbuilt functions.

1. Generating arrays and matrices and their manipulations
2. Introduction on few built-in functions
3. 2D and 3D plots, multiple plots using figure and subplot commands
4. Annotation of plots
5. Simple script files and editing them
6. Introduction of function files
7. Introducing notion of sub-functions and nested functions
8. Solving IVPs using ode45 and other solvers
9. Solving system of linear equations using built in functions

Modes of Evaluation: Quiz/Assignment/ Seminar/Written Examination

SEMESTER-VI

SOLID STATE PHYSICS

Course Code: DPHY2601 **Credit Units: 03**

Course Objective:

The aim of this course is to increase understanding of Physics principles as applied to solid-state materials and to enhance problem-solving and critical thinking skills.

Course Contents:

Module I: Crystal Structure

Crystalline and amorphous solids, Translational symmetry. Elementary ideas about crystal structure, lattice and bases, unit cell, Reciprocal lattice, fundamental types of lattices, Miller indices, lattice planes, simple cubic, f.c.c. and b.c.c. lattices. Laue and Bragg equations. Determination of crystal structure with X-rays. Bragg diffraction. Crystal Structures: sc, fcc, bcc, hcp, diamond, NaCl, CsCl & ZnS.

Module II: Bonding of solids

Different types of bonding- ionic, covalent, metallic, Van der Waals and hydrogen bond, their properties.

Module III: Band theory of solids

Elementary Band theory of solids, Periodic potential and Bloch theorem, Kronig-Penny model, energy band structure. Band structure in conductors, direct and indirect semiconductors and insulators (qualitative discussions), Free electron theory of metals, effective mass, drift current, mobility and conductivity, Weidman-Franz law, Heavy fermions, Hall Effect in metals and Semiconductors: Phenomenology and implication (Qualitative Discussion Only)

Module IV: Dielectric properties of materials and Lattice Vibrations

Polarization. Local Electric Field at an Atom. Depolarization Field. Dielectric Constant. Electric Susceptibility. Polarizability. Classical Theory of Electric Polarizability. Clausius Mosotti Equation. Normal and Anomalous Dispersion.

Lattice Vibrations and Phonons: Linear Monoatomic and Diatomic Chains. Acoustical and Optical Phonons. Qualitative Description of the Phonon Spectrum in Solids. Einstein and Debye Theories of Specific Heat of Solids. T^3 Law.

Module V: Magnetic properties of materials

Dia, para and ferro-magnetic properties of solids. Langevins theory of diamagnetism and paramagnetism. Quantum theory of paramagnetism, Curie's law. Ferromagnetism, Spontaneous magnetization and domain structure; temperature dependence of spontaneous magnetization; Curie- Weiss law, Explanation of hysteresis.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

DEMONSTRATIVE ASPECTS IN MODERN PHYSICS-II

Course Code DPHY2602 **Credit Units: 01**

Course Objective:

The objective of the course is to enable students to understand the aspects of modern physics through experiments. This will enable students to demonstrate the conceptual knowledge through various experiments in Laboratory.

Course Contents: List of Experiments to be performed in Lab

Experiment 1:

To measure the Resistivity of a Ge Crystal with temperature by Four-Probe Method (from room temperature to 200° C) and to determine the Band Gap E_g for it.

Experiment 2:

To determine the Hall Coefficient of a Semiconductor.

Experiment 3:

To study the Hysteresis loop (B-H) of ferromagnetic material.

Experiment 4:

To measure magnetic susceptibility of a solution of a paramagnetic salt in water for 3 different concentrations by using Quincke's method.

Experiment 5:

To study the characteristics of Photovoltaic cell.

Experiment 6:

To measure the dielectric constant of a ferroelectric material as a function of temperature.

Experiment 7:

To study the Forward and Reverse characteristics of a Zener Diode and to study its use as a Voltage Regulator.

Experiment 8:

To determine the velocity of ultrasonic waves using interferometer as a function of temperature.

Examination Scheme:

NUCLEAR & PARTICLE PHYSICS

Course Code: DPHY2603 **Credit Units: 04**

Course Objective: The course aims to introduce students to the fundamental concepts of nuclear and sub-nuclear physics and introduction to the physics behind particle detectors.

Course Contents:

Module I: Nuclear Properties

Constituents of nucleus, Non-existence of electrons in nucleus, Nuclear mass and binding energy, features of binding energy versus mass number curve, nuclear radius, angular momentum and parity, qualitative discussion of two-body nuclear forces, nuclear moments, magnetic dipole moment and electric quadrupole moment,

Module II: Radioactive Decays

Modes of decay of radioactive nuclides and decay Laws, Beta decays: β^{-}, β^{+} and electron capture decays, , Parity violation in βdecay. Alpha decay: Stability of heavy nuclei against break up, Geiger- Nuttal law, barrier penetration as applied to alpha decay, Gamma transitions: Excited levels, Radio carbon dating, Nuclear Power generation (Fission& Fusion Process) & Nuclear Reactor (if time permits)

Module III Nuclear Reactions and Nuclear Models

Types of nuclear reactions, reactions cross section, conservation laws, Kinematics of nuclear reaction, Q-value and its physical significance, compound nucleus. Liquid drop model, semi-empirical mass formula, condition of stability, evidence for nuclear magic numbers, Shell model, energy level scheme (Introductory).

Module IV: Elementary Particles, their Properties and reactions

Historical introduction, Cosmology, fermions and bosons, particles and antiparticles, Classification of elementary particles, types of interactions, electromagnetic, weak, strong interactions, gravitational interactions, Quantum numbers and conservation laws, isospin, charge conjugation, Yukawa theory, Introduction to quarks and qualitative discussion of the quark model and 3 generation of Quarks qualitatively).

MATERIALS SCIENCE

Course Code: DPHY2651 **Credit Units: 04**

Course Objective: The course should enable the students to understand basics of the materials science, different type of materials and explain different types of the phase diagrams, and other related and important topics.

Module I: Different type of materials
Metals and alloys (ferrous and non-ferrous), Ceramics and their properties, Polymers and their properties, Composites, Types of Composites and their Properties, Discussion on advanced materials viz: Superalloys, Shape memory alloys. Nano materials.

Module II: Diffusion and dislocation defects
Diffusion, Types of diffusion, diffusion mechanisms, Factors that influence diffusion, Laws of Diffusion, Diffusion Coefficient, Kirkendall Effect. Dislocation and Strengthening Mechanism: Dislocations and Slip Systems, Slip in single crystals, plastic deformation in polycrystalline materials, strengthening by grain size reduction, solid solution strengthening, strain hardening, precipitation hardening and age hardening, recovery, recrystallization and grain growth.

Module III: Phase diagrams and Phase Transformations
Phase diagram: Basic terms, Gibb's phase rule, Unary phase diagram, Binary phase diagrams and types, Eutectic point, Hume-Rothery's conditions, Lever rule, Interpretation of the phase diagrams. Nucleation, Nucleation kinetics, Homogeneous and Heterogeneous nucleation, Growth and over all transformation kinetics, Development of microstructure, Martensitic Phase Transformation, Continuous cooling transformation diagrams, Applications

Module V: Material Failure
Elastic and Plastic Deformation, Mechanism of Plastic Deformation, ductile to brittle transition, Fracture and its types, fracture toughness, methods of protection against fracture. Fatigue: cyclic stresses, S-N curve, crack initiation and propagation, factors that affect fatigue life. Creep: Generalized creep behavior, stress and temperature effects, Mechanism of creep, creep resistant materials.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

SEMICONDUCTOR PHYSICS AND OPTOELECTRONIC DEVICES

Course Code: DPHY2604 **Credit Units:04**

Course Contents :

Module I: Formation of Energy bands
Formation of Energy bands, Electron effective mass, Concept of holes, Density of states function, Fermi-Dirac probability function and distribution, Equilibrium distribution of electrons and holes in intrinsic semiconductors, the no and po equations, intrinsic Fermi level position, dopant energy levels, Equilibrium distribution of electrons and holes in extrinsic semiconductors, Degenerated, Non-degenerated semiconductors.

Module II: Semiconductor Physics
Drift current density, Mobility Effect, Conductivity, Diffusion Current Density, Total Current Density, the Einstein relation, The Hall Effect, Carrier Generation and Recombination, Continuity Equations, time dependent diffusion equation, Basics of ambipolar effect and its transport equation, Haynes-Shockley Experiment.

Module III: Optoelectronic Devices
Visible and Infrared LEDs (Device structure and Working principle), photoconductor and photodiode (device structure and working principle), p-i-n photodiodes, responsivity, noise and sensitivity, photodiode materials, Tunnel diodes, Impatt diodes and its static and dynamic characteristics, negative differential resistance, PN junction solar cells.

Module IV: Metal-semiconductor contact
MOSFET structure and principle of operation, MOSFET current-voltage characteristics. MOS structure and its energy band diagram, Depletion layer thickness, work function differences, Flat band voltage - charge distribution, capacitance-voltage characteristics and frequency effects.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

INTRODUCTION TO ASTRONOMY & ASTROPHYSICS

Course Code: DPHY2605 **Credit Units: 04**

Course Objective: This course aims at students to get acquainted with big bang picture, dark energy and cosmology.

Course Contents:

Module I: Distance measurement and overview:
Spectrum of EM radiation, Atmospheric absorption, Overview of Astronomy, magnitude, distances, various methods to measure distances. Different types of telescope, Limit of Resolution and resolving power. Overview of major contents of universe, Black body radiation, specific intensity, flux density, luminosity, Apparent and absolute magnitudes,

Module II: Sun and the Stars
Sun as a star, Structure of the Sun, types of stars, Color magnitude diagram, main sequence stars, evolution of stars. White dwarf, neutron star and black holes.

Module III: Galaxies and Extragalactic Astronomy
Milky way galaxy, dynamics of stars, types of galaxies, Hubble classification, the local group, clusters of galaxies.

Module IV: Big Bang Theory & Dark Matter
Morphological classification of galaxies; rotation curve and idea of dark matter; Active galaxies (basic understanding); clusters of galaxies and large scale distribution. Expansion of the universe; Hubble law and Hubble constant; Big-bang picture and Cosmic microwave background radiation (qualitative discussion).

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

LOW TEMPERATURE PHYSICS AND SUPERCONDUCTIVITY

Course Code: DPHY2606 **Credit Units: 04**

Course Objective:

The aim of this course is to get acquainted the students with physics of ultra low temperatures, physics of materials at zero resistance and their applications in our real world.

Course Contents:

Module I: Superconductivity

Basic properties of superconductors, thermodynamics, superconductors in magnetic fields The London equations, electromagnetic properties, penetration depth, Ginzburg-Landau theory, coherence length, type I and type II superconductors, BCS theory, second quantization, Cooper- pairing, energy gap Tunneling, Josephson effects and SIS tunneling, High Tc superconductors, structure, d-wave symmetry, phase diagrams, Coexistence of superconductivity and Magnetism

Module II: Superfluidity

Two – Fluid Model, Bose – Einstein Condensation, Macroscopic Quantum State, Properties of liquid helium-4, Phenomena near The Lambda Point, phase diagrams, Superfluidity: Superfluid phenomena, rollin film, fountain effect, second sound Excitations and vortices in superfluids, Properties of liquid helium-3, the phase diagram, Symmetry properties of superfluid helium-3, Macroscopic Quantum Interference – Josephson Effect, Normal Fluid Density – Quasiparticle Scattering , Collective Excitations, Sound Propagation.

Module III: Cryogenics

Thermal and electrical properties for different materials at low temperature, Thermodynamic Properties, Liquefaction of gases. Regenerative principle Cooling methods above 1K, Joule- Thompson, Gifford-McMahon, evaporation cooling, Cooling methods below 1K, dilution & refrigeration, Methods of liquefaction of gases (Laser Cooling, Cascade process, Linde's process, and adiabatic demagnetization process) – Measurement of cryogenic temperatures.

Module IV: Applications

Overview of applications, squids, microwave devices, power applications of Superconductivity, Applications of Cryogenics and superfluidity

Examination Scheme:

PHYSICS IN DAILY LIFE

Course Code: DPHY2607 **Credit Units: 04**

Course Objective:
Through this course, students can appreciate their surroundings by understanding the basic rules of Nature and able to connect some daily life observations to Physics principles.

Course Contents:
Module 1 GPS (8 hours)
Satellites, Artificial satellites, Global positioning system. Geo stationary satellite.

Module 2 Physics of Climate Change (8 hours)
Paleoclimate, Part 2. Time series and random processes in climate, Role of the atmosphere in climate, Ocean carbon system, Atmospheric chemistry and climate, Ocean physics and climate

Module 3: Home Electricity (8 hours)
AC and DC current, two-way switch, electrical units, paying for electricity, wiring a three pin plug, electrical safety, an electrical fault, earth wire, fuse, Electrostatics, electric potential, current, and resistance, ohm's law, electric power, refrigeration, electric safety

PHYSICS IN DAILY LIFE (PRACTICAL)

List of Experiments
Determining the capacitance of a plate capacitor - Measuring the charge with the electrometer amplifier
Determining the Faraday constant
Investigating the charge distribution on the surface of electrical conductors
Charging and discharging a capacitor when switching DC on and off
Hot-cathode emission in a vacuum: determining the polarity and estimating the specific charge of the emitted charge carriers
Basic electrostatics experiments with the electrometer amplifier
Experiments with a three-phase revolving-armature generator
Working model

SEMESTER-VII

QUANTUM MECHANICS-II

Course Code: DPHY2701 **Credit Units: 03**

Course Objective: The course is intended to introduce the concept of quantum mechanics to students at the advanced level so that they can solve problem of various branches of Physical Sciences.

Course Contents:

Module I: Spin & Identical Particles, Hydrogen Atom and Angular Momentum

Spin, Stern-Gerlach experiment, Pauli spin matrices, eigenvalues of J^2 and Jz, addition of angular momenta, Clebsh-Gordan coefficients. Identical particles, particle exchange operator, symmetric and anti-symmetric wave functions, Pauli principle and Slater determinant, Schrodinger equation in three dimensions (spherical coordinates), separation of variables, radial equation, angular equation, spherical harmonics, angular momentum and their commutation relation, $L^2$and L_z operators, Ladder operator. Spin functions for a system with more than one electron.

Module II: Perturbation theory

Time-independent perturbation theory: Basic concepts, Non-degenerate energy levels, degenerate perturbation theory, fine structure of Hydrogen, Spin-orbit coupling, Zeeman effect. Time-dependent perturbation theory: 1st order perturbation, Fermi's Golden rule, absorption and emission of radiation, Einstein A and B coefficient.

Module III: Variational principle and WKB approximation

Theory of Variational principle; Ground state energy for 1D harmonic oscillator, Delta function potential, and He. WKB approximation, classical region, tunneling, Gamow's theory of alpha decay, connection formula.

Module IV: Scattering theory and relativistic quantum mechanics:

Formulation of scattering theory, scattering amplitude, cross section, Partial wave analysis, optical theorem, Centre of Mass frame, Laboratory frame, partial wave, scattering by a central potential (partial wave analysis), Born approximation: Phase shifts, scattering length and effective range, Low energy scattering Born approximation and its validity. Klien-Gordon equation and its interpretation, Dirac equation for a free particle.

Examination Scheme:

MATHEMATICAL PHYSICS-III

Course Code: DPHY2702 **Credit Units: 04**

Course Objective:
The course introduces the students to the fundamentals of Complex analysis, Matrix and Applications, probability and probability distribution and tensors.

Course Contents:

Module-I: Complex Analysis
Brief Revision of Complex Numbers and their Graphical Representation. Euler's formula, De Moivre's theorem, Roots of Complex Numbers. Functions of Complex Variables. Analyticity and Cauchy-Riemann Conditions. Examples of analytic functions. Singular functions: poles and branch points, order of singularity, branch cuts. Integration of a function of a complex variable. Cauchy's Inequality. Cauchy's Integral formula. Simply and multiply connected region. Laurent and Taylor's expansion. Residues and Residue Theorem.Application in solving Definite Integrals.

Module-II: Matrix and Applications
Elementary transformations and Elementary matrices, Inverse of Matrix using Elementary Transformations, Normal form of a matrix, Linear dependence and independence of vectors, Rank of a matrix, Solution of system of Linear Equations, Definition ,Properties and computation of Eigen values and Eigenvectors, Cayley - Hamilton theorem and its applications, Reduce to diagonal form.

Module-III: Probability and Probability Distributions
Probability, Probability Distribution: Random variable, probability mass function (pmf) and probability density function (pdf), Cumulative distribution function (cdf). Properties and application of Binomial, Poisson and Normal distributions

Module-IV: Tensors
Tensor: Special Coordinate systems; Spherical and Cylindrical coordinates; Tensor analysis; Contraction and Direct Product; Quotient rule, Covariant and Contravariant tensors, Einstein summation convention; Levi-Civita symbols; Metric Tensor.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

DEMONSTRATIVE ASPECTS IN MODERN PHYSICS-III

Course Code: DPHY2703 **Credit Units: 01**

Course Objective:

The objective of the course is to enable students to understand the aspects of modern physics through experiments. This will enable students to demonstrate the conceptual knowledge through various experiments in Laboratory.

Course Contents: List of Experiments to be performed in Lab

Elastic Constants for the material of a given wire by Searle's method
Determination of coefficient of viscosity of water by Poiseuille's flow method
Thermal conductivity of copper by Searle's method.
To determine the height of the tank or building or tower or any object with the help of a sextant.
To determine the variation of Thermo-EMF with temperature
Laser Diode Intensity Modulation and Demodulation Trainer.
Single & Double slit /X-Z long Translational stage silicon Detector with digital Microammeter.
To determine the Stefan's constant
To determine the Rydberg's constant
To study the complete working operation of Metallurgical Microscope

DIGITAL ELECTRONICS & MICROPROCESSOR

Course Code: DPHY2704 **Credit Units: 04**

Course Objectives

This course gives a comprehensive view of Digital Electronics- Number Systems and combinational Circuits. It covers the basics of microprocessors.

Course Contents :

Module I: Number Systems and Combinational Logic

Review of Number System, Decimal, binary, octal and hexadecimal number systems. Conversion from one system to another. Definitions, symbols and truth table of NOT, OR, AND, NAND, NOR, XOR, gates, De Morgan's theorems; The Gray Code, Realization of basic gates using universal gates; Simplifying simple Boolean expressions, Karnaugh-maps.

Arithmetic and Logic Units (ALU)

Half adder, full adder, and 4-bit binary adder, Half subtractor, full subtractor, adder subtractor using full adder IC.

Module II: Flip-Flops, Counters and Shift Registers

Sequential and combinational circuits, Latch, flip-flops, clock signal, Build a flip-flop circuit using elementary gates (RS, clocked RS, D-type, JK), Build a 4 bit counter using D-type JK flip-flop, Make a shift register from D type flip-flop, Serial in Serial out, Serial in Parallel out, Parallel in Serial out, Parallel in Parallel out shift registers.

Module III: Microprocessors

Introduction to Microprocessors, microcomputer organization, 8-bit, microprocessor-Intel 8085 microprocessor, main features, architecture, data and address buses, CPU, ALU, flags and register organization, stack pointer, program counter, timing signals, instruction sets, addressing modes.

Module IV: Interrupts and Interfacing in Microprocessors

8085 interrupts and its classification, Software and hardware interrupts, vectored and non-vectored interrupts, priorities of interrupts. Interfacing memory and I/O devices. Interfacing devices-programmable peripheral interface,

ADVANCED STATISTICAL MECHANICS

Course Code: DPHY2705 **Credit Units: 04**

Course Objectives

The objective of this course is to Introduction to the microscopic formulation of thermal physics, generally known as statistical mechanics. General principles, from which emerge an understanding of the microscopic significance of entropy and temperature and range of applications to simple models of crystalline solids, classical gases, quantum gases and blackbody radiation.

Course Contents:

Module I

Kinetic theory of gas (Revision), Probability concepts in statistical mechanics, Random walk problem, General Aspects of Probability Distributions

The Statistical Basis of Thermodynamics, The macroscopic and the microscopic states, Contact between statistics and thermodynamics, Entropy on microscopic scale, physical significance of the number Ω(N,V,E), Thermodynamic equilibrium, Mechanical equilibrium, Chemical equilibrium, Review of phase space, Liouville's theorem, basic postulates of statistical mechanics, The classical ideal gas, The entropy of mixing and Gibb's paradox, Sackur tetrode equation of entropy, Correct Boltzmann counting

Module II Elements of ensemble theory, microcanonical, canonical, grand canonical ensemble, quantum states and the phase space, equilibrium between system and a heat reservoir, partition function, physical significance of the various statistical quantities in the canonical ensemble, The classical systems, energy fluctuations in the canonical ensemble, statistics of paramagnetism, Boltzmann's equation, Maxwell & Boltzmann statistics, Equipartition theorem and its Simple applications, Virial theorem,. Maxwell velocity distribution, related distributions and mean values.

Module III Equilibrium between a system and a particle- energy reservoir, density and energy fluctuations in Grand canonical ensemble, formulation of quantum statistics, Fermi-Dirac and Bose-Einstein statistics. Applications of the formalism to: (a) Ideal Bose gas, The field of sound waves, Einstein and Debye theory of specific heat, properties of black-body radiation, Bose- Einstein condensation, experiments on atomic BEC,(b) Ideal Fermi gas, properties of simple metals, Pauli paramagnetism, electronic specific heat, Compressibility of Fermi gas, A relativistic degenerate electron gas.

Module IV Phase transition, non-equilibrium statistical mechanics, Ising model, fluctuation-dissipation.

Course Code: DPHY2706 **Credit Units: 04**

Course Contents:

Module I: Need of energy storage - flywheel storage- electrical and magnetic energy storage- capacitors - electromagnets- chemical energy storage- thermo chemical- photochemical- Photovoltaic, biochemical - electrochemical- fossil fuels and synthetic fuels- hydrogen for energy storage -Ragone plot of energy storage devices

Module II: Charge transport properties, capacitance density, impedance, Power density, Review of Faraday's laws, Faradaic and Non-Faradaic processes, conductivity of electrolytes, ionic mobility, Ostwald dilution law, Electrode potentials, Polarization of Electrode, Batteries-classification of batteries-difference between primary and secondary batteries- manganese dioxide batteries -lead acid batteries - nickel cadmium batteries- lithium ion batteries- applications of batteries.

Module III: Materials for energy storage- Applications of Nanomaterials, carbon nanomaterials, graphene, graphene dots, carbon nano tubes, Silicon, Oxide nanomaterials for transparent electrode, Electroluminescence, Solid-state lighting, White light emitting diode, Phosphors materials,

Module IV: Energy applications-, Electrochemical cells, C-V measurement, EIS measurement, Photovoltaic cell, Characteristic of the Photovoltaic Cell, Thin film Solar cell, DSSC, Solar photovoltaic system design and power generation, energy converters, Magnetic and electric energy storage systems Superconducting magnet energy storage system(SMES) -concept of supercapacitor- classification of supercapacitors- working of electrochemical double layer capacitors (EDLC), Pseudo capacitors and hybrid supercapacitors - difference between capacitor, supercapacitor and battery - advantages, disadvantages and applications of supercapacitors. Direct energy conversion devices-thermoelectric effects-thermoelectric power generator, Advantages and Disadvantage magneto hydro dynamic (MHD) generation-MHD generator , power output of MHD generator-advantages and disadvantages MHD system.

Module V: Fuel Cells & Hydrogen Energy Production and Storage

Introduction, electrochemistry, alkaline fuel cells, phosphoric acid fuel cells, solid oxide fuel cells, direct methanol fuel cells, fuel processing, proton exchange membrane fuel cells, fuel processing, Hydrogen pathways, General introduction to infrastructure requirement for hydrogen production, storage, dispensing and utilization, Physical and chemical properties of storage materials – General storage methods, compressed storage – Composite cylinders – Glass micro sphere storage - Zeolites, Metal hydride storage, chemical hydride storage and cryogenic

Module VI: Global Energy scenario, Indian Scenario, energy crises, Industrial demands, impact on human life,

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

ACCELERATORS & DETECTORS

Course Code: DPHY2707 **Credit Units: 04**

Course Contents:

Module I: Interaction of radiation and charged particles with matter

Introduction to radiations, Ionizing and nonionizing radiation, Energy loss of electrons and positrons, Positron annihilation in condensed media, Stopping power and range of heavier charged particles, derivation of Bethe-Bloch formula, interaction of gamma rays with matter, neutron classifications, sources of neutrons, neutron detectors.

Module II: Nuclear radiation detection

Gas-filled detectors, proportional and Geiger-Muller counters, Scintillation detectors, solid-state detectors, Cherenkov effect, specialized detectors, solid state nuclear track detectors, Wilson Cloud Chamber, bubble chambers, nuclear emulsions,

Module III: Accelerators

Van de Graaff Accelerator, Linear accelerators, cyclic accelerators, Cyclotron, Betatron, Synchrocyclotron, ion sources, CERN Super Proton Synchrotron (SPS). Large Hadron Collider (LHC)

Module IV: Applications

Applications in Research, material physics research, medical applications (Synchrotron radiation sources and neutron spallation sources) and radiation protection, Applications in Nuclear and Particle Physics

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

SENSORS

Course Code: DPHY2708 **Credit Units: 04**

Course Objective:
To enable students about sensors and nano sensors.

Course Contents:

Module I: Introduction
Introduction to sensor and transducer; sensor Characteristics, Scaling Considerations, Uncertainty, Calibration, Hysteresis, Nonlinearity, Saturation, Repeatability, Resolution, Transfer Functions, Classification of measurement error

Module II: Physical Principle of sensing
Electric charge, field and potential; Capacitance, Magnetism, Induction, Resistance, Hall Effect, Temperature and thermal properties of material; Thermoelectric Effects

Module III: Applications of sensors
Temperature Sensors, Smoke, Fire; Gas sensors, Chemical and Humidity. Light Detectors, Image Sensors; Humidity and Moisture Sensors, Microphones, Flow Sensors, Pressure Sensors, Force and Strain, Velocity and Acceleration, Presence, Displacement, and Level, Pulse Oximeter, Glucometers, DNA sensor and Immunosensor

Module IV: Nanosensor
Introduction to nanosensors; Classification; MEMS and NEMS, Materials used for nano sensors; Production methods; Photolithography; nanosensors using quantum dots; Application of nano sensor.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

RADIATION PHYSICS AND ITS APPLICATIONS

Course Code: DPHY2709 **Credit Units: 04**

Course Objective: The objective of the course on Radiation Physics is to expose the students of M.Sc. class to the concepts of different kinds of radiations, their interaction with matter, radiation detection and radiation dosimetry. The course will enable students to understand that interaction of matter with different kinds of radiations such as charged particles, electrons, neutrons, EM waves etc. and further their technological applications primarily as radiological applications.

Course Contents:

Module 1: Radiation Sources
Basic units and definitions, Fast electron sources: beta decay, internal conversion & Auger electrons; Heavy charged particle sources: Alpha decay & spontaneous fission; Sources of electromagnetic radiation: Gamma rays following beta decay, Annihilation radiation, Bremsstrahlung, Characteristic X-rays & Synchrotron radiations; Neutron sources: Radioisotope sources & photoneutron sources

Module 2: Radiation Interaction
Interaction of heavy charged particles: Nature of interaction, stopping power, energy loss characteristics, The Bragg curve, Energy straggling, Range & Range straggling, Energy loss in thin absorbers; Interaction of fast electrons: Specific energy loss, Electron range and transmission curves, Interaction of gamma rays: Photoelectric absorption, Compton scattering, Pair production; Interaction of neutrons: Slow neutron & fast neutron interaction; Radiation exposure and dose: Gamma ray exposures, Absorbed Dose, Dose equivalent,

Module 3: Radiation Detectors and Spectroscopy:
General characteristics of detectors: Detector model, Modes of detector operation, Energy resolution, Detector efficiency; Gas filled detectors, Organic and inorganic scintillation detectors, Semi-conductor detectors [Si(Li), Ge(Li) HPGe]. Photomultiplier tubes, Gamma ray spectrometers, Gamma ray spectrometry with NaI(Tl) scintillation and semiconductor detectors; Background and detector shielding.

Module 4: Radiation Dosimetry
Radiation dosimetry, its types and applications: Environmental, space, personal and medical dosimetry; General properties of dosimeter; Thermoluminescence (TL) and its mechanism; TL dosimetry: TL glow curve and TL spectra; Concept of trapping parameters: activation energy, order of kinetics & frequency factor; TLD protocols, optically stimulated luminescence (OSL) based dosimetry

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

VACUUM TECHNOLOGY

Course Code: DPHY2710 **Credit Units: 04**

Course Objective:
Through this course, students will be able to appreciate the basic theories of vacuum technology and the equipment that is used in vacuum- and thin film technology. Students will be able to use the vacuum-based tools in an adequate way and they will have an understanding of vacuum and related issues such as pressure measurement, pumping mechanisms and pumping speed, mean free path etc.

Course Contents:

Module-I: Physics of Rarefied gases (12 hours)
Kinetic Theory of Gases, Gas Laws, Mean free path, Transport processes, viscosity of gases, diffusion of gases, resistance and conductance of vacuum pipework, Gas flow in pipework, pump-down time, adsorption and desorption of gases, solubility of gases, vapor pressure,

Module-II: Production of vacuum (12 hours)
Action & Construction of Rotary Vane pump, Rotary piston pump, Diffusion pump and Roots Blower, Screw/Diaphragm/Claw/Scroll pumps for dry vacuum production, Turbomolecular, Ion & Cryopumps for ultra-high vacuum production, Selection criteria of vacuum pumps for different applications.

Module-III: Vacuum Measurements: (12 hours)
Measurement of Vacuum using Primary & Secondary gauges (U Tube / McLeod / Bourdon / Pirani / Penning / Ionization / Capacitance)

Module-IV: Vacuum Systems and Components: (12 hours)
Vacuum Materials, Valves & Components, Mechanical design of Vacuum vessels, Fabrication and testing of Vacuum chambers, Degassing procedures, Design aspects of Vacuum systems for different applications, Complete design of Vacuum furnace for Metallurgical processing as an example tutorial

Module-V: Applications of Vacuum Technology (12 hours)
Application of Vacuum Technology in Chemical/Pharmaceutical/Food processing and packing/Medical/Solar thermal/Wood processing/Precise lifting applications, Application of Vacuum Technology in Electrical/coating/Electronics/semiconductor and Metallurgical processes, Vacuum aspects of IC chip/Solar PV cell/Mobile/TV/Computer manufacturing, Application of Vacuum in Space (ISRO) and Nuclear (DAE) applications, Nuclear fusion for future clean energy, Space simulation chambers for satellite and space shuttle testing

Course Code: DPHY2739	BASICS OF RESEARCH METHODOLOGY, ETHICS, AND RESEARCH COMMUNICATION	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description

This course aims to provide students with a comprehensive understanding of conducting ethical research, utilizing proper research methodologies, and effectively communicating research findings. The course includes a final project where students will write a Literature Review on a topic chosen in consultation with the teacher(s).

This course is designed to equip students with essential skills and knowledge to conduct ethical research, employ proper research methodologies, and effectively communicate scientific information (with focus on writing a literature review). The course will cover topics such as research design, data collection and analysis, research ethics, and science communication strategies. Through a combination of lectures, discussions, case studies, and practical exercises, students will develop a deeper understanding of the research process and its ethical implications.

Course Objectives

The objective of this course is to impart knowledge about various stages of research process, research ethics and different ways of research communication.

The aim of this course is to impart research skills to the beginners and help to improve the quality of research by the existing researchers. It also encompasses the understanding and application of appropriate research design, statistics, and the use of the computer for reference management, report writing, research paper writing and presentation. The course also introduces the key conceptual issues of each research method, as well as giving practical guidance. It covers the series of research methodology contents: from problem formulation, to design, to data collection, analysis, reporting and dissemination. The course has the dual aims of equipping students with conceptual understandings of current academic debates regarding different methods, and the practical skills to put those methods into practice.

Course Outcomes

On completion of this course, the students will be able to

CO1. Define criteria of good research, steps in research process, and data collection.

CO2. Identify different types of sampling and its purpose.

CO3. Conduct hypothesis testing for different types of samples and interpret the results.

CO4: Learn the importance of literature review, write research paper/thesis, use reference management software.

Course Content :

Module	Topic	**Blooms level***	Hours
1	**Research Methodology** Understanding the research process: From research questions to conclusions	L1, L2	10

Prof. (Dr.) Anil Kumar

	Types of research: Qualitative and quantitative research Exploratory, descriptive, experimental, and correlational studies Scientific Thinking: Subjective Vs. Objective Thinking Logical Reasoning: Inductive Vs. Deductive Reasoning Formulating research hypotheses and objectives Purpose of a good research, Criteria of good research		
2	**Descriptive Statistics** Data, Types of Data, Methods of data collection, Benefits and drawbacks, Graphical representation of data and interpretation. Measures of Central Tendency: Arithmetic Mean, Median, Mode, Measures of Dispersion: Range, Standard Deviation, Variance, Coefficient of Variation.	L1, L2, L3	15
3	**Inferential Statistics** Sampling: Basic concepts, Process of Sampling, Sample Size, Types of Samples, Sampling and non- sampling errors, Statistics and Parameters, Sampling Distribution of Means and Proportion, **Hypothesis Testing**, steps in testing of hypothesis, errors in hypothesis testing, z test and t test.	L1, L2, L3	15
4	**Research Ethics** Plagiarism, Fabrication, Falsification, Ethics with respect to human and Animal Research	L1, L2	5
5	**Communication** Characteristics of a good Research paper, Systematics Literature Review (choosing a topic, preparing outline, gathering authentic & appropriate references, avoiding plagiarism, use of reference management systems), Writing a good literature review, Structure of report (Introduction, Methodology, Analysis, Results, Discussions, Conclusions, Recommendations), Writing Quality Research Paper, Publishing Research Work in Quality Journals, Reference Management Software	L1, L2, L3	15

Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4: Analysis; L5: Synthesis, L6: Evaluation

Modes of Evaluation: Quiz/Assignment/ Seminar/Written Examination

Components	A	CT	Sessional Exam	End Term Examination
Weightage (%)	5	10	15	70

Project based assignment: Student teams (2-3 students per team) will write a literature review on a topic of choice, in consultation with the teacher.

SEMESTER-VIII

ELECTRODYNAMICS

Course Code: DPHY2801 **Credit Units: 04**

Course Objective:

This course aims to broaden your view and deepen your understanding of time-dependent electrodynamic fields, electromagnetic phenomena and wave properties. Students will develop a fairly complete picture of electromagnetism waves and radiations and their interaction with matter.

Course Contents:

Module I: Electric Field in Matter (Electrostatic and Potentials)

Dirac-delta function. Green's theorem Electrostatics: Laplace and Poisson equations; Uniqueness theorem, Dirichlet and Neumann boundary conditions; Method of images (point charge near a conducting plane and a sphere); Separation of variables in Cartesian and spherical coordinates. Boundary conditions on E,

Module II: Magnetic Field in Matter

Magnetic flux, Magnetic effect in static and time dependent field, The Divergence and Curl of a magnetic field; Magnetic Vector Potential; magnetic scaler potential, Divergence of vector potential, potential.

Module III: Electromagnetic Field and potential

Revisit of Basic Electromagnetic Laws and Maxwell equations; Displacement current, Continuity Equation, Electrodynamics potentials, inhomogeneous and homogeneous electrodynamic wave equations, Gauge transformations, Lorentz and Coulomb gauge; Potential and Field of a moving charge. Electromagnetic Wave equations in free space (one dimension)

Module IV: Electromagnetic energy and wave

Poynting's Theorem and Poynting vector; Energy density, energy & momentum of EM waves, plane electromagnetic wave, properties, Propagation of plane electromagnetic wave in matter, conducting medium, dielectric, skin depth, Electromagnetic wave in Ionosphere, reflection and transmission in conducting media;

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

INTRODUCTION TO NANOTECHNOLOGY

Course Code: DPHY2802 **Credit Units: 04**

Course Objective:
This course aims at students to get acquainted with introductory knowledge of Nanotechnology.

Course Contents:

Module I Introduction
Nanoscience and Nanotechnology, Classification of nanostructured materials, Nanoparticles, Length scales, Bohr exciton radius, confinement regimes, Nanomaterials and their types, 1D, 2D and 3D confinement and Concept of quantum dots, quantum wires and quantum wells; Density of states for bulk materials, quantum wells, wires and dots; Importance of size distribution control, size measurement and size selection .The concept of surface energy, Surface to volume ratio, Ultra thin films-multilayered materials,

Module II: Preparation Methods
Bottom-up synthesis, Top-down approach: Mechanical milling, Sputtering, Evaporation. Material processing by Sol – Gel method, Chemical Vapour deposition and Physical Vapour deposition ,Microwave Synthesis of materials, Synthesis of metal & semiconductor nanoparticles by colloidal route, homo- and hetero-nucleation growth methods, Microemulsions, , Gas Phase Synthesis of Nanopowders: – Vapor (or solution) – liquid – solid (VLS or SLS) growth – the Need for Gas/vapor State Processing – Main Stages of Gas Phase Synthesis Lithographic technique

Module III: Characterization Techniques
X-ray diffraction technique, Scanning Electron Microscopy, Tunneling Electron Microscopy, Surface Analysis Techniques- AFM, SPM STM, ESCA.

Module-IV: Properties and Applications of Nanomaterials
Physical and Mechanical properties of nanomaterials, Optical Properties: Optical Properties of metal nanoparticles and Surface Plasmon Resonance; Optical properties of semiconducting nanoparticles: Effect of nanostructure formation on the band gap and photoluminescence, Applications based on band gap engineering Electronic properties: Nanocapacitor and Coulomb blockade in Nanocapacitor, Tunnel Junction, Single Electron Tunneling Oscillations, Single Electron Transistor, Applications based on SET Magnetic Properties: Nanomagnets, Dynamics of nanomagnets, super-paramagnetism, ferrofluids; Applications based on Nanomagnets

Module-V: Special Nanomaterials and their Applications
Details of carbon-based nanostructured materials, Importance, properties and application of CNT, Graphene and Fullerenes, Applications of carbon-based nanomaterials, Zeolites and their applications, Aerogel, Aerosol, Porous nanomaterials along with their applications.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

THIN FILM TECHNOLOGY

Course Code: DPHY2803 **Credit Units: 04**

Course Objective:
To make the students understand the difference between bulk and thin film, the optical, electrical, and dielectric properties of thin film, the theories explaining the formation of thin film and the fabrication and advantages of thin film devices.

Course Contents:
Module-I: Preparation Methods
Physical methods: Thermal evaporation, Cathodic sputtering, Molecular beam epitaxy and Laser ablation methods. Chemical methods: Electrolytic deposition, Chemical vapor deposition.

Module-II: Thickness Measurement and Characterization
Electrical, Mechanical, Optical, Microbalance, Quartz crystal methods. Analytical techniques of characterization: X-ray diffraction, Electron microscopy, High and low energy electron diffraction, Auger emission spectroscopy.

Module-III: Growth and Structure of Films
General Features, Nucleation theories, Effect of electron bombardment on film structure, post-nucleation growth, Epitaxial film growth, Structural defects.

Module-IV: Properties of Thin Films
Understanding the electrical and superconducting behaviour of thin films and hence to draw a valuable conclusion regarding the properties of the material. Mechanical properties: Elastic and Plastic behaviour. Optical properties: Reflectance and transmittance spectra, Absorbing films, Optical constants of film material, Multilayer films, Anisotropic and isotropic films. Electrical properties: Conductivity in metal, Semiconductor and Insulating films, Discontinuous films, Superconducting films.

Examination Scheme:

PHYSICS OF SOLAR PHOTOVOLTAICS

Course Code: DPHY2804 **Credit Units: 04**

Course Objective:
In this course, one would learn about the fundamentals of photoelectric conversion: charge excitation, conduction, separation, and collection. Students will become familiar with commercial and emerging photovoltaic (PV) technologies and various cross-cutting themes in PV: conversion efficiencies, loss mechanisms, characterization, manufacturing, systems, reliability, life-cycle analysis

Course Contents*:*

Module I: Solar Cells and Sunlight
Outline of solar cell development, physical source of sunlight, review of solar intensity at the Earth's surface, solar insolation data,

Module II: Review of Semiconductor Properties
Crystal structures and orientations, forbidden energy gaps, dynamics of electrons and holes, carrier density, carrier transport, generation and recombination of carriers due to light, direct and in-direct band gap semiconductors, basic device physics, p-n junction diode,

Module III: Standard Silicon Solar Cell Technology (1st generation solar cells)
Photovoltaic effect, solar cell output parameters, characteristic lifetime, diffusion length, diffusion coefficient, absorption coefficient, efficiency limits, losses, and measurements. Review of fabrication technology, polysilicon and single crystal silicon cell technologies. Design of Solar Cells, Solar cells to solar module, Development of commercial Si solar cells, process flow of commercial Si cell technology, processes used in solar cell technologies, high efficiency Si solar cells

Module IV: Thin Film Solar cells (2nd – Generation)
Poly-silicon silicon, amorphous silicon, gallium arsenide solar cells, copper sulfide and cadmium sulfide solar cells, potential & drawbacks of currently manufactured technologies (single- and multicrystalline silicon, CdTe, CIGS, CPV)

Module V: Emerging Solar Cells technologies and Concepts (3rd –Generation)
Organic solar cells, Dye-sensitized solar cells, Perovskite solar cells, GaAs solar cells, Thermo-photovoltaic approaches to overcome single junction efficiency limits, spectrum modification approaches, hot carrier solar cells, Quantum Dot solar cells, life-cycle analysis of various solar cells technology

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

ATMOSPHERIC & ENVIRONMENTAL PHYSICS

Course Code: DPHY2805 **Credit Units: 04**

Course Contents:

Module I: General features of Earth's atmosphere: Thermal structure of the Earth's Atmosphere, Composition of atmosphere, Hydrostatic equation, Potential temperature, Atmospheric Thermodynamics, Greenhouse effect, Local winds, monsoons, fogs, clouds, precipitation, Atmospheric boundary layer, Sea breeze and land breeze. Instruments for meteorological observations including RS/RW, meteorological processes and convective systems, fronts, Cyclones and anticyclones, and thunderstorms.

Module II: Atmospheric Dynamics: Scale analysis, Fundamental forces, Basic conservation laws, The Vectorial form of the momentum equation in a rotating coordinate system, scale analysis of equation of motion, Applications of the basic equations, Circulations and vorticity, atmospheric oscillations, Quasi biennial oscillation, annual and semi-annual oscillations, Mesoscale circulations, The general circulations, Tropical dynamics.

Module III: Atmospheric Waves: Surface water waves, wave dispersion, acoustic waves, buoyancy waves, propagation of atmospheric gravity waves (AGWs) in a non-homogeneous medium, Lamb wave, Rossby waves and its propagation in three dimensions and sheared flow, wave absorption, non-linear consideration.

Module IV: Atmospheric Radar and Lidar: Radar equation and return signal, Signal processing and detection, Various types of atmospheric radars, Applications of radars to study atmospheric phenomena, Lidar and its applications, Application of Lidar to study atmospheric phenomenon. Data analysis tools and techniques. Atmospheric Aerosols: Spectral distribution of the solar radiation, Classification and properties of aerosols, Production and removal mechanisms, Concentrations and size distribution, Radiative and health effects, Observational techniques for aerosols, Absorption and scattering of solar radiation, Rayleigh scattering and Mie scattering, Bouguert-Lambert law, Principles of radiometry, Optical phenomena in the atmosphere, Aerosol studies using Lidars.

Examination Scheme:

PLASMA PHYSICS

Course Code: DPHY2806 **Credit Units: 04**

Course Objective: This course aims at exposing the students to the basic knowledge of plasma physics, plasma parameters, to distinguish plasma from a gas, the motion of charged particles under different electric and magnetic field conditions. To study this course, the students will be able to understand the collective behavior of plasma, the techniques of plasma production and diagnostics.

Course Contents:

Module –I: Introduction to Plasma Physics

Plasma state, Natural Plasma, fundamental concepts, concept of temperature, Quasi-neutrality in plasma, density of plasma, electron and ion temperatures, mobility of charged particles, Debye shielding, criteria for ionized gas to be a plasma, dielectric constant of plasma, optical properties of plasma.

Module –II: Orbit Theory of Plasma

Effect of magnetic field on mobility of electrons, Particle motion in a static uniform magnetic field, in uniform force, uniform electric fields, motion in gravitational fields, Grad- B drift, curvature drift, polarization drift, particle in non-uniform magnetic and electric fields, particle in time varying electric and magnetic fields.

Module –III: Fluid description of plasma

Relation of plasma physics and electromagnetic, equation of motion for fluid, equation of continuity, single fluid equations, fluid-drifts perpendicular and parallel to magnetic field, magnetic pressure, magnetic tension, plasma approximation.

Module –IV: Waves in a fluid plasma

Representation of waves, plasma oscillations, electron plasma waves, ion plasma waves, Sound waves, Ion waves, plasma approximation, electrostatic electron waves perpendicular to magnetic, electrostatic ion waves perpendicular to B, Lower frequency waves, Electromagnetic waves, Magnetosonic and Hydromagnetic waves.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

BIOPHYSICS

Course Code: DPHY2807 **Credit Units: 04**

Course Objective:
This course aims at exposing the students to basic Biophysics concepts which will be useful for them to solve the integrated problems of Biology and Physics.

Course Contents:

Module I: General Biophysics and Techniques in Biophysics
Fundamentals of Biophysics, Surface tension, Adsorption, Osmosis, Osmotic pressure, Dialysis, Colloids, Colloidal systems of life, Buffer, Buffer capacity, Buffers in life system, pH, its importance, Basics of spectroscopy, X-ray crystallography, NMR, UV etc

Module II: Molecular Biophysics
Protein structure, Primary, secondary, tertiary and quaternary structure. Main chain and side chain torsion angles, Alpha helix, beta sheet, turns. Ramachandran plot, Allowed conformations for a pair of linked peptide units, Motifs and domains.

Module III: Thermodynamics of Biological System
The first and second laws of thermodynamics, are activation energy. Biological systems as open, non-equilibrium systems, Concept of free energy, unavailable energy and entropy, the heat content of food, bomb calorimetry, Enthalpy, and Negative entropy as applicable to biological systems. thermodynamics of passive and active transport, glycolytic oscillations, biological clocks

Module IV: Biomedical Instrumentation
Basic concepts in medical instrumentation, Basic sensors-principles, transducers, amplifiers, measurement of blood pressure, blood volume, blood flow, respiratory measurements, cardiac output measurements, patient monitoring equipment, audiometers, cardiac pacemakers, surgical diathermy, hemodialysis machine, automated drug delivery systems, ICU and Operation theatre equipment, blood bank instrumentation.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

GROUP THEORY AND CRYSTALLOGRAPHY

Course Code: DPHY2808 **Credit Units: 04**

Course Objective: Mathematical Applications of Symmetry to an object to obtain knowledge of its physical properties.

Course Contents:

Module I: Basics of Group theory:
Theorems of Group Theory, Properties of Group and examples, subgroups, classes. Molecular Symmetry and the Symmetry Groups: Symmetry elements and operations: symmetry planes and reflections, the inversion Center, proper axes and proper rotation, and improper axes and improper rotations, products of symmetry operations, equivalent symmetry elements and equivalent atoms, General relations among symmetry elements and operations, Symmetry elements and optical isomerism, symmetry point groups, symmetries with multiple high- order axes, classes of symmetry operations, a systematic procedure for symmetry classification of molecules. Representations of Groups: Comments on matrices and vectors, representation of groups, Great Orthogonality Theorem and its consequences, character tables, representation for cyclic groups

Module II: Crystallographic point groups: Point group, Hermann-Mauguin symbols for point groups. Basic properties of groups (group axioms, order, multiplication tables, etc.). Subgroups, index, coset decompositions, Development of 32 crystallographic point groups. Stereographic projection and its use for the derivation of crystallographic point groups. Laue classes.

Module III: Space groups: General introduction. Space group operators, The Symmorphic and non-symmorphic space groups, Matrix-column presentation of screw axes and glide planes, Structure of space groups: point groups of space groups. Coset decomposition of the space group concerning its translation subgroup, Space-group diagrams. General and special positions, site-symmetry groups, Derivation of space groups, Orthogonal projections of space groups. (Exercises on space-group diagrams from Volume A of the International Tables for Crystallography).

Module IV: Fundamental principles of X-ray diffraction : Scattering of x-ray by electron, atom and small crystal, Structure factor and Intensity. Typical crystal structure determinations from x-ray powder diffraction data. Determination of crystallite size and strain from x-ray diffraction patterns. ***Fourier Analysis***: Fourier transforms; the relationship between diffraction data and the electron density distribution within a crystal; the phase problem; Fourier maps.

Module V: **Structure Solution and Refinement:** Methods of structure solution, including Patterson maps, direct methods, and the charge-flipping algorithm; structure models and their refinement; validation and critique of structure refinements.

Examination Scheme:

Course Code: DPHY2839	DATA ANALYSIS & VISUALISATION USING SOFTWARE	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	Class X Mathematics				
Co-requisites					

Catalog Description

The implosion of available data has made visualization more critical but also more challenging. Data analysis and Data Visualization are essential tools for business analysis, engineers, policymakers, and decision-makers. Developed originally for "small data", visualization techniques have been met with varied success in the past centuries and decades. There are a few well-known visualizations that are very effective in capturing the essence of the data, and of course, there are many infamous negative examples of poor visuals. An effective visual is critical for decision making it, but it also requires a lot of work, customization, attention to detail, and refinements.

Course Objectives

The course is designed to help students develop skills and knowledge in the following area(s):

- Develop an understanding of what is a good visualization for a given purpose
- Learn visualization theory & techniques
- Build a substantial data analytic project
- Apply data analysis and visualization with Excel, SPSS, R, Python, NVivo and MATLAB

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will be able to articulate meaningful lines of inquiry that might be explored through the collection, organization, visualization, and analysis of data in a context associated with their primary field of study using (as appropriate) numerical, textual, spatial, and/ or visual data.

CO2. Student will understand what data are, how they are collected, and how to assess the quality/ reliability of data.

CO3. Students will demonstrate intermediate proficiency in the visualization of data to communicate information and patterns that exist in the data.

CO4: Students will be able to use at beginning level of proficiency the tools of statistics and machine learning to ask questions of and explore patterns in data.

Course Content :

Module	Topics Covered	Blooms Level	Contact Hours
1	**Module-1: Introduction to Excel** Data Analysis using Excel, Curve fitting, Correlation, Linear Regression, Multiple regression, Principal Component Analysis and Factor Analysis, Hypothesis testing **Introduction to Excel and SPSS** Introduction to SPSS and Types of Data, Importing, exporting and data handling in SPSS; Exploratory data analysis using SPSS and data visualization;	L1, L2, L3, L4	20 hours

	Introduction to statistical inference and various univariate tests by using SPSS; Analysis of Variance (One Way ANOVA, Two Way ANOVA and ANCOVA); Correlation, Simple and Multiple linear Regression Analysis; Principal Component Analysis and Factor Analysis		
2	**Module-2: VOS Viewer** **Web of Science, Scopus, Dimensions, Lens, and PubMed.** Co-authorship networks, citation-based networks, and co-occurrence networks can be created based on data downloaded from Web of Science, Scopus, Dimensions, and Lens. Co-authorship networks and co-occurrence networks can also be created based on PubMed data. **Crossref, Europe PMC, and OpenAlex**. Networks can also be created based on data retrieved through the APIs of Crossref, Europe PMC, and OpenAlex, These APIs can be queried interactively in VOS viewer. **Semantic Scholar, Open Citations, and Wiki Data.** For a given set of DOIs, networks can also be created based on data retrieved through the APIs of Semantic Scholar, Open Citations and Wiki Data.	L1, L2, L3, L4	10 Hours
3	**Faculty of Management Studies & Behavioural Sciences** **Module 3: Domain Specific Software** **- Structural Equation Modelling** **Smart PLS** Introduction to Structural Equation Modelling (SEM), Introduction to the software's AMOS and SPSS, SMART PLS, Testing of Statistical assumptions, Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), common method bias (CMB) test, Measurement Model Assessment, Discussing Fit Indices, Reliability and Validity Testing, Structural Model Assessment identifying multivariate outlier, Construct Validity: Convergent and Discriminant Validity, Measurement Model & Structural Equation Modelling, Mediation and Moderation Effects, Multi-Group Analysis.	L1, L2, L3, L4	30 Hours
	Faculty of Arts **N Vivo** 1. Import text, audio, video, emails, images, spreadsheets, online surveys, web content, and social media from various sources into a simple, intuitive interface.

SEMESTER-I

DFCH2151	FUNDAMENTAL OF FORENSIC SCIENCE	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description:

This course is designed to provide an insight on the fundamentals of forensic science and crime scene investigation at the undergraduate level. It will provide the basic experimental knowledge of working in undergraduate laboratory, i.e., investigation and sketching of indoor and outdoor crime scene, notes making, searching and packaging and forwarding of evidence.

Course Objective:

The course focuses on the following objectives-

- Developing an understanding and appreciation for the scope of Forensic Science in the investigation of cases.
- Develop brief knowledge of the functions and services provided by the Forensic Science Laboratories and Mobile Forensic Units.
- Develop comprehensive knowledge on the concept of Crime Scene Investigation and Reconstruction.
- Develop an understanding on giving an Expert's testimony in court of law.

Course Outcomes:

On the completion of this course, the students will be able to:

CO1. Explain the importance of forensic science and its functioning.
CO2. Acquire skills in securing and preserving the crime scene.
CO3. Identify and recognize physical evidence.
CO4. Investigate and reconstruct the scene of crime and form expert opinion.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Introduction of Forensic Science Forensic Science: Concept, Need and Scope, Principles. History of Forensic Science. Organizational Structure of Central, State, and Regional Forensic Science Laboratories, Divisions/Sections, Roles and Responsibilities of Laboratory Personels. Role of Directorate of Forensic Science Services. Mobile Forensic Science Units – Function, Need, Utility.	L1, L2	12
Module II: Crime Scene Defining a Crime and Crime Scene, Importance of Crime Scene. Types of Crime Scenes: Primary, Secondary, Mobile, Indoor, Outdoor. Types of Physical Evidences, Problems associated with investigating the Crime Scenes. Role of Investigating Officer.	L1, L2	10

DFCH2152	CRIME SCENE MANAGEMENT LAB	L	T	P	C
Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course will give students the basic experimental knowledge of working in undergraduate lab i.e. investigation and sketching of indoor and outdoor crime scene, notes making, searching and packaging and forwarding of evidence.

Course Objective:

The students will understand & perform experiments relating to:

- Investigation of crime scene.
- Sketching of outdoor/ indoor scene of crime
- Packaging and forwarding of Evidence

Course Outcomes

On completion of this course, the students will be able to

CO: Investigate indoor crime scene.

CO2:Investigate outdoor crime scene.

CO3Search, package and preserve the evidence from crime scene.

S. No.	List of Experiments	Blooms level*	Number of hours
1.	Investigation and sketching of indoor scene of crime.	L1, L3, L4	4
2.	Investigation and sketching of outdoor scene of crime.	L1, L3, L4	4
3.	Crime scene photography: indoor, outdoor.	L1, L3, L4	4
4.	Searching of crime scene.	L1, L3, L4	4
5.	Notes making.	L1, L3, L4	4
6.	Packaging and forwarding of physical evidences.	L1, L3, L4	4
7.	Envelop making and druggist fold method.	L1, L3, L4	4
8.	To study the sealing procedure of physical evidence.	L1, L3, L4	2

DFCH2101	PHYSICAL EVIDENCES	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course will help the students to learn the collection, packaging, preservation and analysis of physical evidence from indoor, outdoor and mobile crime scenes.

Course Objective: The course focuses on following objectives-

1. Developing an understanding and application of Forensic Science and significance of various physical evidence.
2. Develop an understanding on Expert's testimony.
3. Develop comprehensive knowledge on Procedure and examination in the Court of Law.

Course Outcomes

On completion of this course, the students will be able to

CO1. Recognise and identify best methods of handling and processing of physical evidence.
CO2. Distinguish between types of crime scenes and linking suspects to crime scene.
CO3. Apply advanced knowledge and forensic concepts in crime solving.
CO4. Examine and prepare report and expert opinion.

Course Contents:

Module	Blooms level*	Number of hours
Module I: Introduction and Handling of Physical Evidence Definition, Types and Significance of Physical Evidence, Collection, Packaging, Preservation and Forwarding of evidence: Biological (urine, blood, semen, saliva, hair, fiber), Chemicals, Poisons, Firearms, Fingerprints, Tool Marks, Soil and Glass.	L1, L2, L3	12
Module II: Introduction to various marks Definition, types, and significance of tool marks, tyre marks, skid marks, tread marks, shoeprints and foot print.	L1, L2	12
Module III: Crime and Suspect Linking a Crime Scene with the suspect through field notes, witnesses and interrogation, Reconstruction of crime scene and associative/ corroborative evidence.	L2	12
Module IV: Documentation of Physical evidence Examinations, report making, chain of custody, report closing. Search and seizure, privilege against self-incrimination, Subpoenas deposition, Miranda rights, Condemned of court, FIR, Types of cognizable and non-cognizable offences.	L1, L2	12
Module V: Examination in the Court	L2, L3	12

DFCH2102	PHYSICAL EVIDENCE LAB	L	T	P	C
Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course introduces students to the experiments of chemical and physical methods of physical evidence

Course Objective: - The students will understand & perform experiments relating to:
1. Analysis of physical evidence
2. Identifying different Physical evidence on the basis of their physical properties.
3. Determine pH, density and refractive index of various physical evidence

Course Outcomes
On completion of this course, the students will be able to
CO1. Identify various types of physical evidence.
CO2. Distinguish and match the crime scene exhibits.
CO3. Examine chemical properties of evidence.
CO4. Examine physical properties of evidence.

Course Contents

Course Contents: Lab/Practical	Blooms level*	Number of hours
1. Collection of various types of physical evidences 2. Collection of negative control sample 3. Packaging of physical evidence 4. Sealing of physical evidence 5. Forwarding of physical evidence	L1, L2	10
6. Microscopic examination of physical properties of soil 7. Solubility examination of soil sample. 8. Determination of percentage of loss of moisture content from soil. 9. Determination of pH of soil samples	L3, L4	8
10. Comparative analysis of glass fragments by mechanical fit method 11. Examination of glass fractures 12. Comparison of density of glass fragments by floatation method	L3. L4	6
13. Comparison of paint chips on the basis of physical characteristics using microscope.	L2	2
14. Microscopic examination of hair samples.	L2, L3	2
15. Comparison of tool marks.	L4	2

SEMESTER-II

DFCH2251	FINGERPRINT SCIENCE	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course is designed to provide an insight on the science of dermatoglyphics or ridge patterns at the undergraduate level. The main objective is to impart essential theoretical and practical knowledge of ridge patterns with special focus on fingerprints among other.

Course Objective:

1. The course provides an in-depth understanding of fingerprints and other dermal patterns.
2. Students will learn about patterns, genetics, and correlations of fingerprints and skin patterns.
3. The course covers the use of these patterns in criminal investigations and identity verification.
4. Students will employ the knowledge practically.

Course Outcomes

On completion of this course, the students will be able to

CO1. Understand the fundamentals of Dermatoglyphics and its history.

CO2: Classifying different types of ridge patterns.

CO3: The physical and chemical techniques of developing fingerprints on crime scene evidence.

CO4: Develop ability to analyze and interpret Dermatoglyphic data from case studies and real-life scenarios.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Introduction to Dermatoglyphics Basics of Fingerprinting- Introduction and history. Formation of ridges Insights into fingerprints, palm prints, and footprints: Their significance in personal identification, Introduction to the Fingerprint Bureau	L1	8
Module II: Ridge Patterns and Forensic Science Biological basis of fingerprints. Fundamental principles of fingerprinting. Types of fingerprints. Fingerprint patterns. Fingerprint characters/minutiae. Plain and rolled fingerprints. Classification and cataloguing of fingerprint record (Henry's, Batley's etc.). Automated Fingerprint Identification System. Significance of poroscopy and edgeoscopy.	L1, L2	10
Module III: Fingerprint Developing Methods Chemistry of latent fingerprint residue, factor contributing to latent fingerprints, Methods of Development of latent fingerprints using conventional methods–Physical- Powder method (Black and grey, fluorescent and magnetic), Iodine Fuming method, Vacuum Metal Deposition (VMD) Method, Chemical method (Ninhydrin, Silver Nitrate). Lifting and preservation, Photography.	L1, L3, L4	6

DFCH2252	FINGERPRINT SCIENCE LAB	L	T	P	C
Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course will give students the basic experimental knowledge of working in undergraduate lab by understanding various methods to develop, identify, characterize and compare fingerprints and other ridge patterns such as lip prints, foot prints etc.

Course Objective:

The students will understand & perform experiments relating to:

- Obtaining and developing fingerprints on various surfaces.
- Development of latent ridge skin patterns using chemical and physical methods.
- Obtaining and characterization of lip-prints.

Course Outcomes

On completion of this course, the students will be able to

CO: Compare fingerprints by characterizing the patterns.
CO2: Learn about dermal ridge patterns in forensic science other than fingerprints.
CO3: Learn about methods to develop latent print patterns

Course Contents:

Modules	Blooms level*	Number of hours
1. Obtaining Plain and Rolled Inked Fingerprints 2. Identifying Fingerprint Patterns	L1, L3	6
3. Ridge Tracing and Ridge Counting 4. Identifying Ridge Characteristics (Minutiae)	L1, L2, L3, L4	6
5. Comparison of Fingerprints 6. Development of latent fingerprints with powders on various surfaces 7. Development of latent fingerprints using iodine fuming method. 8. Development of latent fingerprints using chemical method.	L2, L3	6
9. Obtaining lip-prints and comparison based on classifications. 10. Obtaining footprints and pointing out ridge characteristics	L3	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2201	QUESTIONED DOCUMENTS	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description:
This course is designed to provide an insight on the fundamentals of questioned and security documents at the undergraduate level. It will provide the basic experimental knowledge and skills of working in undergraduate laboratory, i.e., examination of questioned and security documents, basic fundamentals of differentiating handwritings and forgery detection. Students will learn the methods to examine Indian passports, bank cheques and currency notes.

Course Objective:
The course focuses on the following objectives-
1. Developing an understanding and appreciation for the scope of handwriting identification and examination.
2. Develop an understanding on types of questioned documents, the types of forgeries and disguise generally encountered.
3. Develop skills to examine questioned and security documents including handwriting and ink analysis.
4. Develop an understanding and skills to use general and scientific equipment's in the examination of questioned documents.

Course Outcomes:
On the completion of this course, the students will be able to:
CO1. Understand the concept and importance of questioned documents in investigation of case and learn the procedure to present the case in the court of law.
CO2. Identify and apply fundamentals of handwriting to examine forged documents.
CO3. Detect alterations in questioned documents and examine paper and ink.
CO4. Classify and examine identify security documents including Indian passports, bank cheques and currency notes.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Introduction to Questioned Documents Documents, Questioned Documents, Classification of Questioned Documents. Importance, Nature and Problems of Documents. Location, Collection, Handling and Preservation of Documents. Preliminary Examination of Questioned Documents. Adequacy of Exemplars and Standards. Presentation of Report in Questioned Document Examination Cases in Court of Law.	L1, L2, L3	10
Module II: Handwriting Examination Handwriting, Principles of Handwriting, Class and Individual Handwriting Characteristics, Principles of Handwriting Identification, Variations in Handwriting, Handwriting Specimens.	L1, L2, L3, L4	12
Module III: Alteration and Ink Examination Alterations: Erasures, Obliteration, Addition.	L1, L2, L3, L4	10

Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course will help the students to understand the methods to examine questioned documents. Students will understand the methods to examine currency notes and security documents.

Course Objective: - The students will understand and perform experiments related to:
1. Examination of handwriting
2. Examination of security documents
3. Comparison of bite marks and will visit mortuary

Course Outcomes
The main outcomes of the course are given below:
CO1. Students will learn the methods to identify class and individual characteristics of handwriting.
CO2. Students will learn the methods to examine questioned and security documents using optical methods.
CO3. Students will learn the methods to examine currency notes and security documents.
CO4. Students will learn forgery in bank cheques.

SEMESTER-III

DFCH2351	FORENSIC SEROLOGY	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course will help the students to learn the collection, packaging, preservation and transportation of serological evidence from crime scenes. The course will also overview the physio-chemical properties and analysis of these evidence.

Course Objective: This course will cover:
1. Complete and thorough knowledge regarding the various aspects of forensic serology
2. Blood and its detailed study for identification
3. Properties, forensic significance and analysis of various body fluids.

Course Outcomes
On completion of this course, the students will be able to
CO1. Understand and describe the basic properties of serological fluids, and their methods of collection and packaging.
CO2. Perform and identify chemical and microscopic examinations.
CO3. Apply advanced analytical methods of analysis of serological evidence.
CO4. Explain and identify body fluids and their examination.
CO5. Analyse different biological fluids for forensic investigations.

Theory Course Contents:

Modules	Blooms level*	Number of hours
Module 1: Blood and its Properties Physical and chemical properties of blood and blood components, Synthesis of various components of blood, Collection, preservation and packing of blood evidence, procedures and precautions. Blood grouping systems, ABO, Rh and MN system, synthesis of blood grouping antigens, Techniques for determining blood groups.	L1, L2,L3	9
Module 2: Blood Analysis Techniques Presumptive and confirmatory tests for identification of blood/blood stains by microscopic methods, Catalytic tests, and crystal tests.	L1, L2	9
Module 3: Species of Origin & Grouping of Bloodstains Application of Spectrophotometric method, chromatographic and immunological methods (Ring, Precipitin, Ouchterlony, reverse agglutination, normal/mixed agglutination).	L1, L2	9
Module 4: Analysis of semen and saliva	L1, L2, L3	9

DFCH2352	FORENSIC SEROLOGY LAB	L	T	P	C
Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course will help the students to perform various chemical tests on serological evidences such as blood, saliva, urine etc. and presence of toxicological evidences such as poisons and alcohol.

Course Objective: The students will understand & perform experiments relating to:
1. Analysis of blood, biological fluids and alcohol.
2. Thin layer chromatography for poisons.

Course Outcomes
On completion of this course, the students will be able to
CO1. Perform tests on blood
CO2. Perform tests on saliva and urine.
CO3. Perform tests on alcohol and poisons.

Lab Course Contents:

Modules	Blooms level*	Number of hours
1. Analyse different blood groups from the blood found at the crime scene. 2. Perform catalytic test for blood. 3. Perform catalytic test for blood stain. 4. Perform crystal tests for blood. 5. Perform crystal tests for blood stain.	L2, L3, L3, L4	10
6. Analyse biological fluid (saliva)- Amylase test 7. Analyse biological fluid (saliva)- by diffusion. 8. Analyse biological fluid (urine).	L1, L3, L4, L6	10
9. Analyse alcohol, acetone, chloroform 10. Separate metallic poison by thin-layer chromatography (Arsenic, mercury, bismuth, Antimony).	L3, L4	10

DFCH2301	INSTRUMENTATION BIOLOGICAL	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide basic knowledge about the instruments which can be used for the analysis of biological samples. The students will understand the basic principle of the instruments and will be able to apply different techniques as per the requirement of the investigations in medicolegal cases.

Course Objective: The objective of the course is to provide students with practical understanding of the working and applications of various instrumentation techniques used in the forensic science laboratory for the analysis of biological evidence.

Course Outcomes

On completion of this course, the students will be able to

CO1. Explain various biological phenomena associated with Forensic Science and the utility of various biological changes in forensic science.

CO2. Describe the principle, types, and applications of centrifugation in forensic science.

CO3. To understand the various types of electrophoresis for the analysis of biological and toxicological samples

CO4. Analyse the biological samples by immuno-electrophoresis.

CO5. Apply various types of microscopes for the forensic investigations.

Course Contents:	Blooms level	Number of hours
Module I: General Principles of Biological/ Bio-chemical Analysis pH and buffers, Physiological solution, and Cell fractionation. Genetic Manipulations, Enzymes used in genetic manipulation, Cloning procedures, Isolation of specific nucleic acid sequences – complementary DNA, Gene libraries, Colony hybridisation, Expression of genes	L1, L2, L3	12
Module II: Centrifugation Techniques Basic principles of sedimentation, Various types of centrifuges, Density gradient centrifugation, Preparative centrifugation, Analysis of sub-cellular fractions, Ultra-centrifuge- Refrigerated Centrifuges.	L1, L2, L3, L4	12
Module III: Electrophoretic Technique General principles, Factors affecting electrophoresis, Types of Electrophoresis- Agarose gel electrophoresis, Polyacrylamide gel electrophoresis, its types, Isoelectric focusing (IEF), Iso-electrophoresis.	L1, L2, L3, L4	12
Module IV: Immuno-chemical Techniques General principles, Production of antibodies, Precipitin reaction, Gel immuno-diffusion, Immuno-electrophoresis, Radio Immuno-assay (RIA), ELISA, Fluorescence Immuno-assay.	L1, L2, L3, L4	12
Module V: Microscopy	L1, L2, L3, L4	12

DFCH2451	DNA FINGERPRINTING	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course is designed to provide insight on the introduction to DNA fingerprinting in forensic science at the undergraduate level. The main objective of this course is to impart essential theoretical knowledge of chromosomes, their structure, functions, DNA and its application in the field of forensic science.

Course Objective: The objectives of the course are to:

1. Provide a basic understanding of genetics in forensic science.
2. Provide students with technical skills and competencies in DNA fingerprinting techniques.

Course Outcomes

On completion of this course, the students will be able to

CO1. Explain various biological phenomena associated with Forensic Science and the utility of various biological changes in forensic science.

CO2. Describe the principle, types and applications of centrifugation in forensic science.

CO3. Understand the various types of electrophoresis for the analysis of biological and toxicological samples

CO4. Analyse the biological samples by immunoelectrophoretic.

CO5. Describe the mechanism and perform the DNA extraction and quantification.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Introduction to DNA Fingerprinting Definition, Importance of DNA Fingerprinting in Forensic Science, Structure of DNA, RNA, Chromosome, Nuclear DNA and Mitochondria DNA.	L1	9
Module II: DNA Isolation Techniques Collection and types of evidence for DNA fingerprinting. Different types of DNA Isolation techniques (Organic, Inorganic and Mechanical), FTA cards for isolation of DNA, and DNA isolation from different evidence (tissue, hair, bone, blood and seminal stains).	L1, L2	9
Module III: Techniques for DNA Fingerprinting Electrophoresis, Northern and Southern blotting. Polymerase Chain Reaction (Denaturation, annealing and extension, Detection of PCR products).	L3, L4	9

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module IV: Types of DNA Fingerprinting Techniques Mini satellites and Micro-satellites., VNTR and RFLP, AFLP, STRs, SNP and Genotyping.	L3	9
Module V: Practical Application of DNA Fingerprinting Paternity testing and Personal identification. DNA databank, Limitations of DNA Fingerprinting, Chimerism. Legality of DNA Fingerprinting in India. Next-generation sequencing.	L1, L3, L4	9

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Suggested Readings:

1. Norah Rudin and Keith Inman (2nd Edition) An Introduction to Forensic DNA Analysis, CRC Press, New York, 2002.
2. Sharma, B. R. (3rd Edition) Forensic Science in Criminal Investigation and Trials, Universal Law Publishing Co. Ltd. New Delhi, 2001.
3. John M. Butler (1st Edition) Fundamentals of Forensic DNA Typing, Academic Press, 2005.

Modes of Evaluation: Quiz/Assignment/Seminar/Written Examination

DFCH2452	DNA FINGERPRINTING LAB	L	T	P	C
Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course is intended for students to understand various aspects of toxicological evidence in related field.

Course Objective: - The students will understand & perform experiments relating to:

1. DNA properties, extraction and quantification
2. DNA Isolation techniques

Course outcome: On completion of this course, the students will be able to
CO1. Describe the mechanism of DNA extraction.
CO2. Explain the centrifugation technique.
CO3. Discuss the difference between electrophoresis and spectroscopy.

Lab Course Contents:

Modules	Blooms level*	Number of hours
1. Preparation of different buffers for DNA extraction from plant cells 2. DNA extraction from plant cells 3. Preparation of different buffers for DNA extraction from animal cells 4. DNA extraction from blood. 5. Centrifugation technique for biological fluids 6. Agarose gel electrophoresis. 7. Immunodiffusion- Single immunodiffusion 8. Immunodiffusion- double immunodiffusion 9. Spectrophotometry. 10. PCR Technique	L1, L2, L3, L4	30

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Suggested Readings:

1. A Glencoe Program Physics principles and problems: Forensic Laboratory Manual Student edition.
2. Thomas Kubic, Nicholas Petraco Forensic Science Laboratory Manual and Workbook, Third Edition 2009
3. G.H. Stout & L.H. Jensten, X-ray Structure Determination – A practical Guide; 2nd Edn. Wiley, New York, 1989

DFCH2401	FORENSIC TOXICOLOGY	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course is intended for students to understand various aspects of toxicological evidence in related field.

Course Objective: - The objectives of the course:

1. 1The students understand the various types of drugs and toxic substances encountered in an investigation.
2. The varied toxicological signs and symptoms of different toxins on the body when administered.
3. To ensure that the students understand the nature of the toxicological investigations undertaken in forensic laboratories

Course outcome: On completion of this course, the students will be able to
CO1. Describe the mechanism of drug action and interactions in body.
CO2. Explain the drug movement and distribution in body & their examination.
CO3. Discuss the difference between use and abuse of drugs and their laboratory analytical methods.
CO4. Classify the poison and identify them in forensic science laboratory.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Introduction to Toxicology Introduction, History of toxicology and poisons, definition, Dose: Fetal Dose, Lethal Dose, LD50, routes of administration of poisons, classification of poisons on mode of action basis, analytical method basis and medicolegal basis, and Role of Toxicologist in a forensic science lab	L1, L2	10
Module II: Drugs of Abuse Introduction, definition, classification of drugs and drug of abuse, drug addiction, sedatives, narcotics, stimulants, hallucinogens, designer drugs, their mode of action, dosage, signs and symptoms, Analysis hierarchy of seized drugs, examination, clandestine laboratories and drugs related Crime. Drugs of abuse in sports and doping, narcotics drugs and psychotropic substances, designer drugs and their forensic examination, Pharmacology and Toxicology of Psychotropic Drugs: Sedatives, Stimulants, Opiates. Extraction, Isolation of drugs from viscera, tissues and body fluids. Drugs and Cosmetic Act, Excise Act, NDPS Act.	L1, L2	13

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module III: Toxicology and examination of Alcohol Ethyl alcohol and Methyl alcohol: Nature, administration, symptoms, post-mortem findings, medico-legal findings, Country made liquor, Illicit liquor, Methylated spirit isolation, detection. The fate of ethyl alcohol in the body, alcohol in the circulatory system, breath test instruments, field sobriety testing, analysis of blood for alcohol.	L2, L3	12
Module IV: Corrosives and Insecticides Introduction, classifications of acids and bases. Nature, administration, symptoms, post-mortem findings, isolation, detection and estimation, medico-legal findings. Organophosphorus compounds, Organochloro Compounds and Carbamates- Nature, administration, symptoms, post-mortem findings, isolation, detection, estimation, and medico-legal findings.	L2, L3	13
Module V: Instrumentation for Drug analysis -; Introduction to different techniques used in toxicology; Basic principle of chromatography and its forensic applications (Thin Layer Chromatography (TLC), Gas Chromatography (GC) and High pressure liquid chromatography (HPLC)) (in brief).	L2. L3	12

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2402	FORENSIC TOXICOLOGY LAB	L	T	P	C
Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended for students to perform various practical in the field of Forensic Chemistry & Toxicology, to isolate different toxic substance, perform thin layer chromatography of several drugs and cations and anions analyses.

Course Objective:

The students will understand & perform experiments related to:-

1. Isolation techniques for different poisons
2. Analysis of different poisons
3. Spot tests for different cations and Anions

Course Outcome

On completion of this course, the students will be able to

CO1. Demonstrate the isolation techniques of different toxic substances.
CO2. Perform the TLC and analysis of various drugs and poisons.
CO3. Perform various tests to analyze cations and anions.

Course Contents: - Lab/Practical	Blooms level	Number of hours
1. Isolation techniques of different toxic substances 2. TLC of insecticides, Barbiturates and other drugs 3. Spot test of mercury, iron, copper, aluminium, cadmium, zinc and other metallic poisons	L1, L2, L3, L4	8 6
4. Analysis of volatile and non-volatile poisons 5. Analysis of vegetable poisons	L1, L2,	6
6. Spot test of nitrates, nitrites, carbonates, sulphates, sulphites, chlorates	L1, L2, L3, L4	10

SEMESTER-V

DFCH2551	COMPUTER FORENSICS	L	T	P	C
Version 1.1		3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course introduces undergraduate students to the principles and practices of computer forensics. It covers the techniques for identifying, preserving, analyzing, and reporting digital evidence in computers and digital storage devices, with an emphasis on legal and ethical considerations.

Course Objective:

1. Understand the role of computer forensics in legal contexts.
2. Learn methods for the collection and analysis of digital evidence.
3. Develop skills in various computer forensic tools and software.
4. Gain insight into the legal and ethical dimensions of digital investigations.

Course Outcomes

On completion of this course, the students will be able to

CO1: comprehensively understand the field of computer forensics.

CO2: Become proficient in the legal and ethical considerations of computer forensics.

CO3: Ensuring meticulous evidence collection, analysis, and maintenance of the chain of custody.

CO4: Develop practical skills in acquiring, preserving, and analyzing digital evidence.

Course Contents:

Modules	Blooms level*	Number of hours
Module 1: Introduction to Computer Forensics Overview of computer forensics: Definition, scope, and importance; Types of digital evidence and their significance in investigations; Legal aspects: Laws governing digital evidence, ethical issues, and chain of custody	L1	8
Module 2: Data Acquisition and Storage Formats Understanding Storage Formats for Digital Evidence– Raw Format, Proprietary Formats, Advanced Forensic Formats (E01, AF, AFF4, .mdb, .psd etc.). Tools for data imaging and duplication; Ensuring integrity of evidence - Hashing algorithms; Securing and preserving digital evidence.	L1, L2	8
Module 3: Platform-Specific Forensic Analysis Forensic Analysis of File Systems: Windows file system -FAT12, FAT16, FAT32 and NTFS, UNIX file Systems- EXT and Mac file systems- APFS; Understanding digital storage devices (Hard drives, SSDs, USBs, etc.); Basics of data organization and storage.	L1, L3	10
Module 4: Network Forensics and Advanced Analysis Techniques Basics of network forensics: concepts and tools; Techniques for capturing and analyzing network traffic and intrusions; Advanced forensic analysis: encrypted data, cloud storage, and mobile devices; Dealing with anti-forensic techniques and challenges.	L2, L3	8

Manesar Gurgaon-122413

Module 5: Introduction to Digital Forensic Analysis Tools Overview of digital forensic analysis tools, including EnCase, FTK, and Autopsy. Importance of system artifacts in investigations. Exploration of common Windows and UNIX/Linux artifacts. Concepts of file signatures and metadata, and their roles in forensic analysis. Methods for extracting and analyzing artifacts from email clients and web browsers.	L3, L4	12

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2501	INSTRUMENTATIONS (PHYSICAL & CHEMICAL)	L	T	P	C
Version 1.1	Date of Approval: December 2023 December, 2021	3	1	0	4
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description
Instrumental Analysis provides a sound knowledge of the various analytical techniques used to examine different kinds of evidence recovered from scene of crime in forensic cases. It develops the ability to analyze different kinds of physical evidence of forensic importance.

Course Objective: The objective of the course is to provide student with practical understanding of the various instrumentation and control systems, instrumentation equipment and troubleshooting skills used in the forensic science laboratory.

Course Outcomes: On completion of this course, the students will be able to
CO1. Communicate the concept, basic principle and instrumentation of various chromatographic techniques.
CO2: Describe the concept, basic principle and instrumentation of spectrophotometry.
CO3: Explain the potential utility of AAS and UV-Visible spectroscopy in instrumentation.
CO4**:** Explain and analyse the chromatographic techniques such as TLC, GC, HPLC, Hyphenated Techniques etc.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Spectrophotometry-I Electromagnetic spectrum, Sources of Radiation, Types of sources and stability, wavelength selection, filters-cells and sampling devices, detectors, resolution, qualitative and quantitative methods for detection, UV-Visible, FTIR, Raman spectroscopy, Fluorescence spectrophotometry, difference between Atomic spectrum and Molecular spectrum.	L2, L3	12
Module II: Spectrophotometry-II Atomic emission spectroscopy, atomic absorption spectrometry: Principle, Instrumentation techniques quantitative analysis, application of AAS, and ICP in Forensics. X-ray absorption and fluorescence methods, X-ray diffraction, Applications in Forensic Science. Neutron Activation Analysis: Introduction, principle, theory, instrumentation, and forensic applications.	L3, L4	12
Module III: Chromatographic Techniques-I Definition and Concept of Chromatographic methods, Classification of Chromatographic methods: Adsorption and Partition Basic principle, theory, instrumentation of Paper chromatography, Types of Chromatography: Radial, Ascending and Descending Chromatography, and its forensic applications. Basic principle, working and forensic application	L1, L2	12

DFCH2502	FORENSIC MEDICINE	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course will help the students to learn Post-mortem examinations; external examination; internal examination; collection, preservation and packaging of viscera and nature and causes of injuries.

Course Objectives: The student will understand
1. About the scope of different types of injuries, causes and manner of death and their medico legal significance
2. About the utility of the injury assessment in medico legal cases.

Course Outcomes
On completion of this course, the students will be able to
CO1. Describe various physiological and chemical changes after death and will be able to estimate time since death.
CO2. Identify the type of wound and its causes, also they can estimate the age of injury.
CO3. Identify type of dentition and can estimate the age, sex and race of individual by analyzing the given teeth.
CO4. Analyse the types of bitemarks and their significance in identification of culprit and type of crime.
CO5. Explain different types of injuries and their causes and medico-legal significance.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Autopsy and Postmortem Changes Ante and Post-mortem examinations; external examination; internal examination; collection, preservation and packaging of viscera Post- mortem changes, Assessing and determining the time and cause of death.	L1, L2	9
Module II: Wound Healing Mechanism Introduction to wounds; definition, Mechanism of wound production & healing, Determining the age of the injury, and medico-legal aspects of injuries.	L1, L2	9
Module III: Injuries due to Mechanical Force Blunt force injuries- Abrasions, Bruises, Lacerations; causes, characteristic features, types, differences in antemortem & postmortem injuries and their medico-legal aspects. Sharp force injuries- Incised, Stab, Punctured wounds - causes, dimensions, antemortem & postmortem injuries.	L1, L2	9
Module IV: Burn Injuries Injuries due to heat (dry burn, scald, electrocution, chemicals and radiation) and cold. Feature of injuries and their medicolegal significance.	L1, L2, L3	9
Module V: Asphyxia deaths Asphyxia and its types, Medicolegal aspects of smothering, gagging, choking, traumatic asphyxia, burking, etc., Mechanism of death by	L1, L2, L3	9

DFCH2503	CRIMINOLOGY, CRIMINAL LAW & POLICE ADMINISTRATION	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course provides basic knowledge and understanding of Criminology and criminal laws. Knowledge and understanding of basic concepts of crime and criminal behaviour and factor of Crime and Ctheory, Criminal Justice System in India structural and functional process. This course focuses on educating the students about criminal laws of IPC and Cr. P.C. This course serves as a prerequisite for better understanding of Police Administration of India development and history and responsibilities .

Course Objective: The course focuses on following objectives-

1. Developing an understanding and appreciation for the scope of Criminology and criminal laws.
2. Develop an understanding on concepts of crime, types of crime and criminal behavior.
3. Brief description on Juvenile delinquency, types, classification and factors responsible.
4. Develop comprehensive knowledge on Role of Police with regard to criminals, society and custodial crimes
5. 5Understand the punishments and victimology

Course Outcomes: On completion of this course, the students will be able to

CO1. Summarize Criminology and criminal laws and their application in forensic science.
CO2. Describe various concepts of crime and criminal behaviour and factor of crime and criminology theory, criminal Justice system in India structural and functional process.
CO3. Categorize the criminal Laws of IPC and Cr. PC.
CO4. Apply comprehensive knowledge of Police Administration of India development and history and responsibilities and powers, and laws in forensic investigation
CO5 Enhance skill of penology and victimology

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Criminology and Criminal Behavior Definition: Crime, Criminal and Criminology; Criminology as Science, The field and scope of Criminology; Methods and Techniques in Criminology; Concept of a criminal and classification of criminals. Organized crime; White – collar crimes/ Occupational crimes; Murders; Sexual offences; Terrorism; Serial Crimes; Crime against women and children POCSO ACT	L1, L2	7
Module II: Types of offences Bailable, and nonbailable, cognizable, non-cognizable, warrant issue, custodial circumstances, victim offender relationship**.**	L1, L2, L3	8
Module III: Juvenile Delinquency Definition, Types of Juvenile Delinquents ; Classification of Juvenile Delinquents; Factors in Juvenile Delinquency, Custody of juvenile delinquents; Juvenile courts procedure; behavior modification techniques; Preventive Programmes and theories and techniques of rehabilitation	L1, L2, L3	7
Module IV: Penology Concept of punishment, kinds of punishments, Humanitarian approach to concept of punishment, capital punishment in India, Introduction to criminal Laws: IEA, IPC and CrPC.Civil Law	L1, L2	7

Prof. (Dr.) Anil Kumar

SEMESTER-VI

DFCH2651	BIOMETRIC TECHNOLOGY AND MATLAB	L	T	P	C
Version 1.1		3	0	2	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course offers comprehensive insights into both physiological and behavioral biometric systems, highlighting their strengths, weaknesses, and applications.

Course Objective: This course will cover:

1. Introduce the fundamentals of biometrics, exploring its advantages and common applications.
2. Understand the the technologies, components, and the pros and cons of each method.
3. Explore behavioral biometrics, focusing on voice, signature, and gait analysis.
4. Provide in-depth knowledge on gait pattern analysis.

Course Outcomes:

CO1: Understand the foundational principles of biometrics.
CO2: Gain expertise in physiological biometrics.
CO3: Acquire comprehensive knowledge of behavioral biometrics.
CO4: Grasp the fundamentals of MATLAB for forensic investigations.

Course Contents:

Modules	Blooms level*	Number of hours
Module 1: Biometric Fundamentals Biometric fundamentals – Biometric technologies – Biometrics Vs traditional techniques, Characteristics, Benefits of biometrics, Components and steps of a biometric system, Key biometric processes: verification, identification and biometric matching, Types of biometrics and commonly used biometrics and their applications	L1, L2	9
Module 2: Physiological Biometrics Leading technologies: Finger-scan, Facial-scan, Iris-scan – components, working principles, competing technologies, strengths, and weaknesses – Other physiological biometrics: Hand-scan, Retina-scan – components, working principles, competing technologies, Automated fingerprint identification systems (AFIS), Gait Pattern Analysis.	L1, L2	9
Module 3: Leading Behavioral Biometrics technologies Voice scan – Signature scan– Gait scan- components, working principles, strengths and weaknesses, challenges, and scope of behavioral biometrics. Speech-Phonetics-Speech Synthesis-Automatic speech recognition, speech recognition versus voice recognition.	L1, L2	9
Module 4: Introduction to MATLAB Basics and Definitions: Acquisition; Noise filtering; Image Enhancement Region of interest extraction; Feature Extraction; Classification	L1, L2, L3	9

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2601	FORENSIC PHYSICS	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is designed to provide insight of basic knowledge about the various types trace evidences and their forensic significance. The students will be able to ascertain the velocity of vehicle in hit-n-run cases with skid marks analysis along with transferred paint and examination of paint flakes. The course will also help the students to differentiate between the different fractures of glass.

Course Objective:

This course will cover:

1. Important physical evidences found at crime scene along with their significance.
2. General characteristics and identification of physical evidences.
3. Analytical examination and evidential value of important physical evidences.

Course Outcomes

On completion of this course, the students will be able to

CO1. Analyze the soil evidence and to define its type and significance with their properties and analytical examination.

CO2. Identify and differentiate between various types of glasses and fractures.

CO3. Explain the importance of paint as evidence and its significance in hit-n-run cases along with application of analytical techniques in its examination.

CO4. Analyse the types of Tool marks and restoration of erased/ obliterated marks and their casting, lifting and comparison.

Course Contents	Blooms level*	Number of hours
Module I: The Metric System Introduction to the metric system, Introduction to prevalent physical evidence (soil, glass, fibre, hair and liquids).	L1	**15**
Module II: Glass Examination Glass: Types of glass and their composition (organic and inorganic elements), Chemical and Analytical examination of glass fragments, Forensic examination and significance of glass fractures.	L1, L2, L3, L4	**15**
Module III: Paint Examination Introduction to paint chemistry, Types of paints, Their composition and Forensic examination of paints, Types, Significance and Forensic examination of fiber evidence.	L1, L2, L3, L4	**15**
Module IV: Soil examination	L1, L2. L3	**15**

DFCH2602	FORENSIC PHYSICS LAB	L	T	P	C
Version 1.1	Date of Approval: December 2023	0	0	2	1
Pre-requisites/Exposure					
Co-requisites					

Catalog Description:
The course includes the analytical physical techniques to analyse the trace or physical evidences like soil, glass, paints etc. including casting of tyre marks and shoeprints, comparison of bangles and fibres.

Course Objective: The students will be able to understand & perform experiments relate to the examination of physical properties of physical evidences commonly encountered at the crime scene.

Course Outcomes
On completion of this course, the students will be able to
CO1. Examine of soil exhibit by different analytical methods
CO2. Examine Glass sample by different analytical methods
CO3. Perform comparative analysis of paints by TLC
CO4. Casting of different marks and analyse fibres and bangles.

Course Contents: Lab/Practical	Blooms level	Number of hours
1. Examination of various types of glass fractures hit by projectile 2. Comparison of density of glass fragments by density gradient methods. 3. Comparison of broken pieces of glass bangle by physical matching followed by determining the thickness of the glass fragments	L1, L3, L4	6
4. Solubility examination of paints. 5. Comparative analysis of paints by TLC 6. Distribution of components in paint chips.	L1, L3, L4	6
7. Microscopic examination of fibres 8. Burring tests of fibres 9. Solubility examination of fibres 10. Examination and comparison of fabric from the different sources	L1, L3, L4	8
16. Size distribution analysis of soil particles. 17. Microscopic examination of distribution of various particles in soil sample	L1, L3, L4	4
18. Examination of tyre marks 19. Casting of shoeprints 20. Examination of Tool marks	L1, L3, L4	6

DFCH2603	FORENSIC BALLISTICS	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

The course is designed to provide basic and analytical knowledge of the firearms, types, firing range and the analysis of the GSR components.

Course Objective: - The objectives of the course:

1. To understand the role of ballistics in Forensic Science
2. Classification of firearms, determination of the range of firing, methods of laboratory examination of fired cartridges and firearms.
3. The students will also learn to reconstruct the sequence of events in cases involving firearms.

Course Outcomes: On completion of this course, the students will be able to

CO1. Explain the history and types of Firearms

CO2. Describe various types of ammunition

CO3. Explain about the Internal and External ballistics.

CO4. Restate the concept of linkage of bullets and Cartridge Cases and examination of Gun Shot Residue along with determination of range of firing.

Course Contents	Blooms level*	Number of hours
Module I: Introduction to Firearms and their Characteristics: Definition and scope, Firearms, Indian Arms Act, History and mechanism of Muzzle loaders (Match lock, Wheel lock, Flint lock firearms), Briefs of Pinfire, Rimfire and Centrefire systems of cartridge, Characteristic features of the firearms, various types of modern firearms, Types of evidences associated, classification of firearms on different basis, bore characteristics, Introduction to Shotgun, Revolver, Pistol, Rifle and Country Made/ Improvised Firearms. Proof marks of weapons.	L1, L2	**12**
Module II: Types of Ammunition: Ammunition Components of Shotgun and Rifled firearm cartridges, Headstamp markings on ammunition. Various types of bullets and their compositional aspects, latest trends in their manufacturing and design, smooth bore, and improvised ammunition.	L1, L2, L3, L4	**12**
Module III: Internal and external Ballistics: Internal Ballistics: Definition, shapes and manner of Propellant burning, Muzzle velocity and Factors affecting muzzle velocity, ballistic coefficient, phenomenon of ricochet External Ballistics: Definition- Bullet Trajectory and factors affecting bullet flight. Wound Ballistics: Definition of wound ballistics, Ballistic aspect of	L1, L2, L3, L4	**12**

firearm injuries, significance of studying cavitations in body, Bullet Entry/Exit Hole Identification, Evaluation of accident, suicide, homicide firearm injuries.		
Module IV: Bullet linkage: Different types of marks produced during firing process on bullet-number/direction of lands and grooves, width of lands and depth of grooves, angle and pitch of rifling, striation marks on lands and grooves, techniques for obtaining test material from various types of weapons and their linkage with fired ammunition, class, and individual characteristics.	L1, L2, L4	**12**
Module V: Range of Firing determination: Introduction and methods of estimation. Gunshot Residue: Introduction and methods of analysis. Bullet and Cartridges matching: Ejecta, burning, scorching, blackening, tattooing and metal fouling, shots dispersion and GSR distribution, time of firing – different methods employed, and their limitations, stereo & comparison microscopy, automatic bullet, and cartridge comparison.	L1, L3, L4	**12**

Catalog Description

This course introduces students to the experimental analysis to identify the types of firearms and their ammunition and to establish the linkage between the fired ammunition and firearm along with GSR analysis.

Course Objective: - The objectives of the course:

1. To understand the parts of firearms
2. To understand the different types of ammunition
3. To analyse the Gunn shot residues

Course Outcomes

On completion of this course, the students will be able to

CO1. Identify the parts of firearms
CO2. Examine the types of ammunitions
CO3. Analyse the gunshot residues
CO4. Link a bullets, Cartridge Cases and firearms.

Course Contents	Blooms level*		Number of hours
1. To identify the country made firearms 2. To identify the improvised firearms	L1, L2		**4**
3. To identify the type of ammunition recovered 4. To identify the 12 bore shotgun 5. To identify the pellets and wads 6. Ammunition Components of Shotgun 7. Ammunition Components of Rifled firearm cartridges	L3		**10**
8. Identification of parts of firearm • Shotgun • Rifle • Pistol	L3		**6**

DFCH2605	FORENSIC ANTHROPOLOGY	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	0	0	3
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description

This course will help the students to understand the basic meaning of forensic anthropology and its utility in the investigation of medico-legal cases. This course will also describe the methods to examine the human skeleton.

Course Objective:

The given course is designed to:

1. Provide knowledge about the basics of physical anthropology
2. Develop a comprehensive understanding of different techniques for determining the identity of unknown remains.
3. Provide an understanding of the process of forensic facial reconstruction and its utilization in personal identification

Course Outcomes

On completion of this course, the students will be able to:

CO1 Describe the basic concepts of anthropology.
CO2 Identify human bones based on their anatomical features.
CO3 Learn the methods to determine height and race from a human skeleton.
CO4 Determine the stature of an individual based on bones and the human skeleton.
CO5 Determine sex by the various bones.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Introduction to Forensic Anthropology Definition, scope and application of Forensic Anthropology and related sciences. Human skeletal system, and types of bones.	L1	9
Module II: sex determination from Bones Characteristic features of different human bones. Sex determination from skull, mandibular, and pelvic bones.	L1, L2	9
Module III: Age Estimation from Bones Primary and secondary ossifications of bones. Estimation of age from skull, sternum, long bones (humerus, radius, ulna, fibula, tibia, femur), pelvic bone, foot and hand bones.	L1, L2	9
Module IV: Stature and Race Determination Race and height determination from long bones and their medico-legal implication. Establishment of Partial and Complete identity of skeletal material and dead bodies.	L1, L2	9
Module V: Forensic Odontology Types of dentitions, Basic structure of human teeth, types of teeth & their morphology, Determination of age from teeth using various methods, Dental anomalies and their role in personal identification.	L1, L2	9

Lab Course contents*:*

Modules	Blooms level*	Number of hours
1. Identification of the human skeleton system. 2. Identification of various bones (Pelvic and Skull bones). 3. Estimation of height using long bones. 4. Determination of sex from the skull, pelvis and mandibular bone. 5. Determination of age using skull. 6. Dental and bite mark analysis 7. Age estimation by dentition.	L1, L2, L3	30

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Suggested Readings:

SEMESTER-VII

DFCH2701	FORENSIC PSYCHOLOGY	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to give insight of providing the basic knowledge about the human behavior, and its impact on social environment. The students will be able to explain cognitive neuroscience and associated disorders. The course will help the students to understand the concept of investigative psychology and criminal profiling.

Course Outcomes

On completion of this course, the students will be able to

CO1. Explain the concepts of emergent fields of cognitive neuropsychology.

CO2. Describe brain-behaviour relationship in day to day life

CO3. Apply practical implications of cognitive processes in human performance.

CO4. Analyse impact of intelligence and decision making and language on personal behaviour

CO5Apply the concepts of investigative psychology to elicit criminal profiling.

CO, PO, PSO Mapping

FCH2702	DIGITAL FORENSICS	L	T	P	C
Version 1.1		3	0	2	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course provides an in-depth exploration of cyber-criminal behaviors, the dynamics of network communication, tools for investigation and analysis, and the critical aspects of operating systems. Students will learn about the various challenges in cyberspace, methodologies for digital evidence collection, and advanced techniques for system analysis.

Course Objective

1. Understand the threats in networks and security concepts.
2. Apply authentication applications in different networks.
3. Understand security services for email.
4. Awareness of firewall and it applications.

Course Outcomes:

CO1: Understand the complex landscape of cyberspace, recognizing various computer crimes.
CO2: Acquire skills in network forensics.
CO3: Master the tools and techniques related to network security.
CO4: Understanding the core functionalities of operating system.

Course Contents:

Modules	Blooms level*	Number of hours
Module 1: Introduction to Digital Forensics Definitions, Scope, and Fundamentals of digital forensics; Forensic Analysis: Scientific, Data abstraction Layers, Physical and Logical acquisition, Evidence Dynamics, Comparison and Identity; Crime reconstruction	L1, L2	8
Module 2: Forensic Analysis Introduction, Applying scientific methods to digital forensics, Uses of digital forensic analysis, evaluation of source, digital document authentication; Data gathering and observation.	L1, L2, L3	8
Module 3: Electronic Discovery Introduction, Legal Context, Case management, Identification of e-data, Forensic preservation of data, data processing, production of e-data	L1, L2, L3	8
Module 4: Intrusion Investigation Methodologies, preparations, common observations, collection, analysis, combination, feeding analysis, detection phase; Embedded Systems Analysis, Network and mobile network investigation: Introduction, Definition and Operation, Preserving Traces, Data Collection, Information Recovery	L1, L2, L3	10

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2703	ADVANCED FORENSIC CHEMISTRY & TOXICOLOGY	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course is intended for students to understand the adulteration present in petroleum products, the drugs, food product, cosmetics etc. and various related acts and trap case analysis.

This course will also make them understand the investigation and examination of fire, arson and explosives along with the drug of abuse, toxicology and examination of metallic poisons

Course Objective: The objectives of the course are to:

1. Impart the knowledge to students about the adulteration in petroleum products, drugs food product, cosmetics and various related acts along with trap case analysis.
2. Provide scientific knowledge to investigate and examine the scene of fire, arson and explosive.
3. Provide insight about the toxicology, pharmacology of drugs of abuse, NDPS, metallic poisons along with their extraction and examination.

Course Outcomes

On completion of this course, the students will be able to

CO1. Understand the acts related to adulterants in drugs and cosmetic and will also be able to analyze the adulterants in petroleum products, drugs, food product along with tape case analysis.

CO2. Investigate the arson cases and examine the arson evidences.

CO3. Examine the post blast residue

CO4. Extract, isolate and analyze the drug of abuse along with the metallic poison.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Adulterants and Law related to Drugs, Food product, Cosmetics and Excise Properties of petroleum Product, Analysis of adulteration in Petroleum products: Diesel, Petrol, Kerosene, Adulteration in Food product, Adulteration in construction product. NDPS Act 1985, Drugs and Cosmetic Act 1940, Excise Act, The Drugs Control Act, 1950, Prevention of food adulteration act 1954. Examination of Trap Cases	L1, L2, L3	12
Module II: Investigation and Forensic Examination of Arson Cases Arson scene investigation: Collection and preservation of Arson evidence. Instrumental Analysis and identification of accelerants, flammable liquids, ignitable materials, Extraction of ignitable liquid residue from debris: Solvent extraction methods and Distillation methods, Clean-up procedure: Filtration & Acid stripping, Chemical analysis, Instrumental analysis: GC, GC-MS, and Head Space GC.	L2, L3, L4	12

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module II: Post blast investigation and Analysis of explosive residue Systematic examination of Post blast explosive residue- Extraction by solvent extraction method based on solubility: Organic solvent extraction for organic explosives, Water extraction for Inorganic anionic explosives, Alkali extraction for metallic explosives, Pyridine extraction for elemental sulphur. Chemical analysis: Solubility test, Flame test and Spot test. Instrumental Analysis: TLC, HPLC, GC-MS, GC, IR, SEM/EDX OR XRF, XRD, CE, ICP, AAS, UV	L3, L4	12
Module III: Drugs of Abuse and Metallic Poisons Introduction, classification of drugs of abuse, drugs of abuse in sports and doping, narcotics drugs and psychotropic substances, designers drugs, Mechanism of action, their Sign and Symptoms, Forensic examination. Introduction to metallic poisons, Mechanism of action, Sign and Symptoms and Medico-legal aspect.	L2, L3, L4	12
Module IV: Toxicology and its Law Definition, Law relating to poison, Classification of poisons: Based on action, Physical State, Toxico-analytical, Medico-legal, Based on purpose (Intention) - Factors affecting the action of poisons, routes of administration of poisons.	L2, L3	12
Module V: Forensic Pharmacology Pharmacology and Toxicology of Psychotropic Drugs: Sedatives, Stimulants, Opiates. Examination of Drugs: Extraction and Isolation of drugs from viscera and body fluids: Extraction of Metallic poisons, Anions, Organic Volatile, Organic Inorganic, Vegetable poisons, Acidic poisons, Basic Poisons, Neutral Poisons.	L3, L4	12

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2704	QUALITY MANAGEMENT AND ACCREDITATION IN FORENSIC SCIENCE LABORATORIES	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Catalog Description
This course is intended for students who have never learned about quality management and technical requirement in forensic laboratories. A knowledge of the process of accreditation and the basic requirements for a testing and calibration laboratory to be accredited is a must for the student of forensic science.

Course Objective: This course aims to introduce the students to the Quality management system and requirements for the competence of testing and calibration, the technical requirements needed in a laboratory.

Course Outcomes
Upon completion of this course, the students will be able to
CO1. Apply quality management in forensic laboratories.
CO2. Summarize the technical requirements for a forensic laboratory to be accredited.
CO3. Perform sampling, handling of test and calibration items, as well as assuring the quality of test and calibration results and reporting the results in forensic cases.
CO4. Set up the forensic laboratory information management system.

Course Contents:	Blooms level	Number of hours
Module I: Quality management and accreditation agencies General requirements for the competence of testing and calibration laboratories – Introduction, scope, management requirements: Organization, Quality system, Document control, Review of requests Organizations involved in setting guidelines and maintaining quality systems: National Accreditation Board for Testing and Calibration Laboratories (NABL), International Laboratory Accreditation Co-operation (ILAC), Asia Pacific Laboratory Accreditation Co-operation (APLAC). International Organization for Standardization (ISO), Bureau of Indian Standards (BIS).	L1, L2	10
Module II: Management Requirements II Internal Audits; Control of records, Corrective and preventive actions, Tenders and contracts, Sub-contracting of tests and calibration, Purchasing services and supplies, Service to the clients, Complaints	L1, L2, L3	10
Module III: Technical Requirements I Technical requirements: General, Personnel, Accommodation and Environmental conditions, Test and Calibration methods.	L1, L2, L3	10

DFCH2705	FORENSIC GENETICS	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course will help the students to understand important fundamental concepts of human anatomy and physiology at the undergraduate level. The main objective is to prepare students for the study of the basic tissues, respiratory system, cardiovascular system, excretory system, nervous system, endocrine system and fluid electrolytes etc.

Course Objective:

1. Understand the foundational concepts of genetics.
2. Comprehend the molecular structure of DNA and its significance in forensic investigations.
3. Analyze chromosomal structures and their implications in forensic genetics.
4. Recognize the impact of genetic mutations and their applications in forensic science.

Course Outcomes

On completion of this course, the students will be able to

CO1: Demonstrate a comprehensive understanding of genetics.

CO2: Analyze and interpret the molecular structure of DNA.

CO3: Evaluate chromosomal structures understanding their implications in forensic genetics.

CO4: Apply knowledge of genetic mutations, the Hardy-Weinberg equilibrium, and other genetic principles to real-world forensic scenarios.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Foundations of Genetics Introduction to Genetics: Mendelian Genetics: Laws of Inheritance, Exceptions to Mendel's laws, Genes: Structure, Function, and Regulation, Genetic Variation: Sources and Importance in Forensics.	L1, L2 and L3	10
Module II: Nucleic Acids Introduction to Nucleic Acids: DNA and RNA. DNA Structure: Double Helix, Bases, and Backbone (Watson & Crick Model). DNA Replication, Transcription, and Translation: The Central Dogma. DNA Profiling: Techniques and Applications in Forensic Science.	L1, L2, L3	8
Module III: Chromosomes and Genetic Mapping Chromosome Structure and Function: Eukaryotic vs. Prokaryotic. Human Karyotype: Chromosomal Abnormalities and Forensic Implications.	L1, L2, L3	6

DFCH2739	BASICS OF RESEARCH METHODOLOGY, ETHICS, AND RESEARCH COMMUNICATION	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description

This course aims to provide students with a comprehensive understanding of conducting ethical research, utilizing proper research methodologies, and effectively communicating research findings. The course includes a final project where students will write a Literature Review on a topic chosen in consultation with the teacher(s).

This course is designed to equip students with essential skills and knowledge to conduct ethical research, employ proper research methodologies, and effectively communicate scientific information (with focus on writing a literature review). The course will cover topics such as research design, data collection and analysis, research ethics, and science communication strategies. Through a combination of lectures, discussions, case studies, and practical exercises, students will develop a deeper understanding of the research process and its ethical implications.

Course Objectives

The objective of this course is to impart knowledge about various stages of research process, research ethics and different ways of research communication.

The aim of this course is to impart research skills to the beginners and help to improve the quality of research by the existing researchers. It also encompasses the understanding and application of appropriate research design, statistics, and the use of the computer for reference management, report writing, research paper writing and presentation. The course also introduces the key conceptual issues of each research method, as well as giving practical guidance. It covers the series of research methodology contents: from problem formulation, to design, to data collection, analysis, reporting and dissemination. The course has the dual aims of equipping students with conceptual understandings of current academic debates regarding different methods, and the practical skills to put those methods into practice.

Course Outcomes

On completion of this course, the students will be able to

CO1. Define criteria of good research, steps in research process, and data collection.

CO2. Identify different types of sampling and its purpose.

CO3. Conduct hypothesis testing for different types of samples and interpret the results.

CO4: Learn the importance of literature review, write research paper/thesis, use reference management software.

Course Content :

Module	Topic	**Blooms level***	Hours

SEMESTER-VIII

DFCH2801	WILD LIFE FORENSIC AND ENTOMOLOGY	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide advanced knowledge of the forensic wildlife and entomology, environmental forensics, and forensic microbiology. The students will understand the advanced analytical techniques to detect poaching. It will be helpful in providing knowledge of the various branches of biology and their direct applications in the criminal investigation.

Course Objective: During the course the students will be able to

1. Understand the scope of wildlife forensics and litigation of environmental forensics.
2. Understand and appreciate the diversity and utility of variety of botanical evidence.
3. Elaborate concepts of entomology, microbiology.
4. Estimate the time since death by life cycle of different insects.

Course Outcomes

On completion of this course, the students will be able to

CO1. Describe entomology, time since death by insects, collection and preservation of the entomological evidences and role of insects in toxicological analysis.

CO2 Elicit the significance of microbial diversity and its applications in forensic investigation.

CO3. Explain significance of botanical evidences such as wood, leaves, pollens etc in forensic investigations

CO4. Analyse diatoms for forensic examination of drowning deaths and role of microbes in these investigations and forensic techniques environmental litigation.

CO5. Explain and analyse wildlife forensics, Wildlife life protection Act and significance of wildlife evidences for criminal investigations and species identification.

Course Contents	Blooms level	Number of hours
Module I: Forensic Entomology & Entomotoxicology History, significance, determination of time since death- Dipterans larval development- life cycle of blowfly, housefly. Importance of Insects in Forensic Investigation Insects as an evidentiary tool in drug abused cases, Effect of drugs & toxins on development of insects and larvae feeding on corpses. Toxin & Drug metabolite Identification and analysis from Insects feeding on Corpses	L1, L2	7
Module II Forensic Microbiology Scope of Microbiology in Forensic Investigation Sterilization Techniques-Physical Agents, Microbial Diversity and its application in forensic investigation Different methods of Isolation of microorganisms from forensic samples like vomitus,stool,stomach wash and residual food.	L1, L2, L3	8

Prof. (Dr.) Anil Kumar

Manesar Gurgaon-122413

Module III: Forensic Botany Introduction, types, location, collection ,evaluation and forensic significance. Morphological and anatomical characteristics of Plants yielding drugs,of abuse like Opium, Cannabis,Cocoa Plant, Psilocybe mushrooms, and Tobacco **Wood:** Type of wood and their identification and comparison. **Leaves:** Identification of various types of leaves and their anatomy, methods of comparison. Forensic Palynology Identification and Analysis of Pollen Grains for Criminal Investigation Starch and Toxic Plant Metabolite	L1, L2, L3	6
Module IV: Forensic Diatomology and Environmental Forensics **Diatoms** Nature, location, structure, extraction from various body tissues, including bone marrow, preparation of slides, methods of identification and comparison, forensic significance. Introduction & application of environmental forensics, Principles and method of chemical fingerprinting(Crude oil and refined products, Forensic techniques used in environmental litigation	L1, L2, L3	7
Module V: Wildlife Forensics Importance of Wildlife Species in Ecosystem,Endangered and Rare Species- Wildlife Management, Different methods of killing and Poaching of Wildlife animals, Scientific methods of Identification & Investigation Poaching and Pugmarks Analysis Types of Wild life Crimes Wildlife (Protection) Act,1972 Identification and Analysis of wildlife materials such as skin, fur, bones, nails, horn, teeth, flowers, and plants, by conventional and modern methods,	L1, L2, L3	8

DFCH2802	CYBER SECURITY	L	T	P	C
Version 1.1		3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description

This course provides an in-depth exploration of cyber-criminal behaviors, the dynamics of network communication, tools for investigation and analysis, and the critical aspects of operating systems. Students will learn about the various challenges in cyberspace, methodologies for digital evidence collection, and advanced techniques for system analysis.

Course Objective

- Understand the threats in networks and security concepts.
- Apply authentication applications in different networks.
- Understand security services for email.
- Awareness of firewall and it applications.

Course Outcomes:

CO1: Understand the complex landscape of cyberspace, recognizing various computer crimes.
CO2: Acquire skills in network forensics.
CO3: Master the tools and techniques related to network security.
CO4: Understanding the core functionalities of operating system.

Course Contents:

Modules	Blooms level*	Number of hours
Module 1: Cyberspace Ethical hacking, Attack Vectors, Cyberspace and Criminal Behaviour, Clarification of Terms, Traditional Problems associated with Computer Crimes, Computer language, Network Language, Realms of Cyber world, brief history of the internet, contaminants and destruction of data, unauthorized access, computer intrusions, white-collar crimes, viruses and malicious code, virus attacks, pornography, software piracy, mail bombs, exploitation, stalking and obscenity in internet.	L1, L2	8
Module 2: Network Forensics Network Forensics: Networking, Overview of OSI Model and TCP/IP Protocol. IP Addressing and NAT. Types of IP addresses, Digital and Analog Signaling Methods, Network Types (LAN, MAN and WAN) and Topologies, Network Hardware devices (hubs, switches, bridges, repeaters, routers etc.) and Client/Server Computing, Routers and Routing Protocols. Monitoring of computer network and activities, Live Packet Capturing and Analysis. Searching and collection of evidences from the network. Network Intrusion Detection and Analysis. SQL Injection, Event Log Aggregation – role of logs in forensic analysis, tools and techniques.	L1, L2, L3	12

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar

Manesar Gurgaon-122413

Investigating network attacks. Evidence collection from Routers and CCTV DVRs.		
Module 3: Network Security Investigation Tools, e-discovery, EDRM Models, digital evidence collection and preservation, email investigation, email tracking, IP tracking, email recovery, search and seizure of computer systems, password cracking.	L1, L2, L3	8
Module 4: Operating Systems Operating System: Introduction, Objectives and Functions of Operating System. Types of Operating system- Windows, Linux, Mac, Booting process of computers. Windows artifact analysis, Internet Artifacts, OS Artifacts, File System Artifacts, Registry Artifacts, Application Artifacts, Report Writing.	L1, L2, L3	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2803	ARSON AND EXPLOSIVES	L	T	P	C
Version 1.1	Date of Approval: December 2023 December, 2021	3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course is intended for students to understand the basics of fire, arson and explosives, its classification, composition and analysis in the field of forensic science.

Course Objective: The objectives of the course are to:

- Provide the scientific knowledge and understanding of types of Fire and Explosion.
- Provide illustrations of fire investigation through a wide range of fire and explosion investigation case studies.
- Examine the fire and arosn evidences along with explosive residue.

Course Outcomes
On completion of this course, the students will be able to
CO1. Understand the Chemistry of fire, types of Fire and their forensic significance
CO2. Examine the Arson evidences and their interpitation.
CO3. Classify the explosives and their mechanism of explosion.
CO4. Investigate the scene of Explosion and analyze the explosives.

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Fire and Arson Introduction, Types of Fire: Natural fire, Accidental fire and Malicious Fire; Cause of Fire: Natural fire, Accidental fire and Malicious Fire Laws related to arson, Forensic importance and prerequisites for the cause of Arson cases; Investigation of scene of Natural fire, Accidental fire and Arson cases; Collection and preservation of Arson evidence.	L1, L2	12
Module II: Laboratory Examination of Arson Evidence Identification of flammable liquids, Extraction of ignitable liquid residue from debris, Interferences in debris, Analysis and interpretation.	L2, L3	12
Module III: Explosives Introduction to explosives, definition, Mechanism of Explosion: Deflagration and Detonation, Classification of Explosives and their Types: Low explosives and High explosives; Improvised Explosive Devises: Definition, Classification of IEDs.	L2, L3, L4	12
Module IV: Investigation of Scene of Explosives: Systematic Investigation of scene of explosion: Protection, collection of explosives residue from debris from scene of explosion.	L1. L2	12

Prof. (Dr.) Anil Kumar

DFCH2804	ADVANCED FORENSIC BIOLOGY AND SEROLOGY	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide advanced of the forensic biology and anthropology. The students will understand the advanced analytical techniques. It will be helpful in providing knowledge of the various branches of biology and their direct applications in the criminal investigation.

Course Outcomes

Upon completion of this course, the students will be able to

CO1. Explain wildlife forensics, Wildlife life protection Act and the significance of wildlife pieces of evidence for criminal investigations and species identification.

CO2. Describe various concepts of entomology and its forensic relevance

CO3. Apply various techniques and instruments for individual identification from blood and other biological fluids and presentation of these evidence in court of law.

CO4. Develop comprehensive knowledge of biological fluids.

Course Objectives:

During the course the student will

- Understand and appreciate the scope of forensic biology and Forensic serology
- Understand and appreciate the scope, diversity, and utility of a variety of Human, Animal and plant evidence and their examination
- Learn the primary technique used for the identification of various biological evidence
- Acquire the knowledge on techniques presently being used in the forensic examination of biological evidences and biological fluids

Course Contents	Blooms level	Number of hours
Module I: Introduction to Wildlife Forensics Introduction to wildlife forensics, Examination of pug marks, horns, skin, fur, hair, nail, and teeth. Identification of some endangered species of plants and animals. Wildlife life protection Act.	L1, L2	9
Module II: Forensic Entomology and Forensic Microbiology Collection of insects, Shipment of collected insects, Identification of insects and their stage of growth. Determination of the post-mortem interval in homicide investigations, Forensic Entomo-toxicology. Forensic Microbiology: Definition, Types and identification of Bacteria and Viruses in Forensic Science, Microbial profiles as identification tools, use of microorganisms in bioterrorism, Anthrax, transmission of HIV as a criminal act, role of microbes in food poisoning.	L1, L2, L3	9

Module III: Forensic Anthropology Somatometry, Osteometry and Craniometry. Identification of individuals from skeletal remains, Collection, Handling, preservation of skeletal remains of forensic science and report writing.	L1, L2	9
Module IV: Blood stain analysis Bloodstain characteristics. Impact bloodstain patterns. Cast-off bloodstain patterns. Projected bloodstain patterns. Contact bloodstain patterns. Blood trails. Bloodstain drying times. Documentation of bloodstain pattern evidence. Crime scene reconstruction with the aid of bloodstain pattern analysis.	L1, L2, L3	9
Module V: Biological markers analysis: Cellular antigens, ABO blood groups, Extracellular proteins and intracellular enzymes, Typing of Biochemical Markers, Forensic Significance of Biochemical markers for identification and individualization	L1, L2, L3, L4	9

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DFCH2805	ADAVNCED QUESTIONED DOCUMENTS & FINGERPINTS	L	T	P	C
Version 1.1	Date of Approval: December 2023	3	1	0	4
Pre-requisites/Exposure	Nil				
Co-requisites					

Catalog Description
This course will help the students to understand the importance of questioned documents and their examination. Students will also learn examination of questioned documents.

Course Objective: The objective of this course is-
1. To develop an understanding and appreciation for the scope of Questioned Documents.
2. To develop an understanding on different types of questioned documents, the types of forgeries and disguise generally encountered.
3. To provide brief description on general equipment used in examination of Questioned Documents.
4. Developing an understanding and appreciation for the scope of Fingerprints Examination.
5.To Develop an understanding on various methods of development of Fingerprints.

Course Outcomes: On completion of this course, the students will be able to
CO1 Learn the basic concept and classification of questioned documents.
CO2 Learn the methods to detect alterations and examine paper and ink.
CO3 Learn the procedure to present the case in court of law.
CO4 Learn the basic concept and classification of security documents
CO5 Distinguish and categorize characteristics of fingerprints for proper collection and preservation

Course Contents:

Modules	Blooms level*	Number of hours
Module I: Types of Questioned Documents Forgery and its characteristics, erasures, obliteration, alteration and addition.	L1, L2	3
Module II: Detection of Alterations Detection and deciphering of indented writing, charred documents, invisible and secret writings Security Documents and Their Examination Introduction to security documents, Types of security documents, Examination of Passports and fake currency notes, Latest introduced security features for identification of genuine bank notes(new series) 50,100,200,500,2000 rupees	L2	9
Module III: Ink Examination and Paper Comparison Composition of major classes of inks (carbon ink, fountain ink etc.), analysis of writing inks and ink dating, pencil lead examination and age of documents,	L3, L4	9

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Physical characteristics of paper, watermark examination, fibre analysis, chemical and trace elements analysis.		
Module IV: Report Writing and Case Presentation Comparison with standards: admitted and specimen samples, report writing, Presentation of report in questioned document examination cases in Court of Law.	L1, L2	6
Module V: **.Introduction of Fingerprint and its characteristics** Biological significance of skin pattern, Types of fingerprints, Fingerprint characteristics: class and individual, Collection, lifting and preservation of fingerprints, Photography of latent fingerprints and presentation of fingerprint evidence in court. **Classification of Fingerprints** Henry's system of classification, Batley's Single Digit classification, Extension of Henry's system of classification. Primary, secondary, sub-secondary, major, Second sub-secondary, key and final classifications	L2, L3, L4	9

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Suggested Readings:

DFCH2839	DATA ANALYSIS & VISUALISATION USING SOFTWARE	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	Class X Mathematics				
Co-requisites					

Catalog Description

The implosion of available data has made visualization more critical but also more challenging. Data analysis and Data Visualization are essential tools for business analysis, engineers, policymakers, and decision-makers. Developed originally for "small data", visualization techniques have been met with varied success in the past centuries and decades. There are a few well-known visualizations that are very effective in capturing the essence of the data, and of course, there are many infamous negative examples of poor visuals. An effective visual is critical for decision making it, but it also requires a lot of work, customization, attention to detail, and refinements.

Course Objectives

The course is designed to help students develop skills and knowledge in the following area(s):

- Develop an understanding of what is a good visualization for a given purpose
- Learn visualization theory & techniques
- Build a substantial data analytic project
- Apply data analysis and visualization with Excel, SPSS, R, Python, NVivo and MATLAB

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will be able to articulate meaningful lines of inquiry that might be explored through the collection, organization, visualization, and analysis of data in a context associated with their primary field of study using (as appropriate) numerical, textual, spatial, and/ or visual data.

CO2. Student will understand what data are, how they are collected, and how to assess the quality/ reliability of data.

CO3. Students will demonstrate intermediate proficiency in the visualization of data to communicate information and patterns that exist in the data.

CO4: Students will be able to use at beginning level of proficiency the tools of statistics and machine learning to ask questions of and explore patterns in data.

Course Content :

Module	Topics Covered	Blooms Level	Contact Hours
1	**Module-1: Introduction to Excel** Data Analysis using Excel, Curve fitting, Correlation, Linear Regression, Multiple regression, Principal Component Analysis and Factor Analysis, Hypothesis testing **Introduction to Excel and SPSS** Introduction to SPSS and Types of Data, Importing, exporting and data handling in SPSS; Exploratory data analysis using SPSS and data visualization; Introduction to statistical inference and various univariate tests by using SPSS; Analysis of Variance	L1, L2, L3, L4	20 hours

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Manesar Gurgaon-122413

	(One Way ANOVA, Two Way ANOVA and ANCOVA); Correlation, Simple and Multiple linear Regression Analysis; Principal Component Analysis and Factor Analysis		
2	**Module-2: VOS Viewer** **Web of Science, Scopus, Dimensions, Lens, and PubMed.** Co-authorship networks, citation-based networks, and co-occurrence networks can be created based on data downloaded from Web of Science, Scopus, Dimensions, and Lens. Co-authorship networks and co-occurrence networks can also be created based on PubMed data. **Crossref, Europe PMC, and OpenAlex**. Networks can also be created based on data retrieved through the APIs of Crossref, Europe PMC, and OpenAlex, These APIs can be queried interactively in VOS viewer. **Semantic Scholar, Open Citations, and Wiki Data.** For a given set of DOIs, networks can also be created based on data retrieved through the APIs of Semantic Scholar, Open Citations and Wiki Data.	L1, L2, L3, L4	10 Hours
3	**Faculty of Management Studies & Behavioural Sciences** **Module 3: Domain Specific Software** **- Structural Equation Modelling** **Smart PLS** Introduction to Structural Equation Modelling (SEM), Introduction to the software's AMOS and SPSS, SMART PLS, Testing of Statistical assumptions, Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), common method bias (CMB) test, Measurement Model Assessment, Discussing Fit Indices, Reliability and Validity Testing, Structural Model Assessment identifying multivariate outlier, Construct Validity: Convergent and Discriminant Validity, Measurement Model & Structural Equation Modelling, Mediation and Moderation Effects, Multi-Group Analysis.	L1, L2, L3, L4	30 Hours
	Faculty of Arts **N Vivo** 1. Import text, audio, video, emails, images, spreadsheets, online surveys, web content, and social media from various sources into a simple, intuitive interface. 2. Create and NVivo project, import and organise qualitative and quantitative data 3.Manage a literature review in NVivo		

Prof. (Dr.) Anil Kumar

PHYSICAL CHEMISTRY LAB

Course code: CHY4105 **Credit Units 02**

(Minimum 10 Experiments to be performed)

Phase Equilibria:

1. Determination of mutual solubility curve of phenol and water and find consolute point.
2. To determine the distribution coefficient of I_2 between two immiscible solvents(CCl_4 andH_2O).

Chemical Kinetics:

3. To study kinetically the alkaline hydrolysis of ethyl acetate.
4. To study the kinetics of reaction between $K_2S_2O_8$ and KI.:
    a. Determination of the rate constant and order of reaction.
    b. To study the influence of ionic strength on the rate constant.
5. Determination of the effects of change of temperature, concentration of reactant and and ionic strength of the media on the velocity constant of hydrolysis of an ester

Electrochemistry:

6. Determination of the velocity constant, order of the reaction and energy of activation for saponification of ethyl acetate by sodium hydroxide conductomertically.
7. Determine the equivalent conductance of weak electrolyte at infinite dilution by Kohlrausch law.
8. Determination of solubility and solubility product of sparingly soluble salts (e.g., $PbSO_4$, $BaSO_4$) conductometrically.
9. Determination of the strength of strong and weak acids in a given mixture conductomerically.

Potentiometry:

10. Measurement of pH of buffer solution
11. Determination of the strength of strong and weak acids in a given mixture using a potentiometer/pH meter.
12. Acid base titration in a non-aqueous media using a pH meter.

Colligative Properties

13. Determination of depression in Freezing point of solutions.

Adsorption

14. Determine the adsorption isotherms of acetic acid from aqueous solutions by charcoal and verify Freundlich adsorbtion isotherm.

***MSDS -Compilation of MSDS of chemicals used by students in each experiment is compulsory**

Examination Scheme:

IA				EE	
A	**PR**	**LR**	**V**	**PR**	**V**

ORGANIC CHEMISTRY LAB

Course Code: CHY4106 **Credit Units: 02**

(Minimum 10 Experiments to be performed)

Qualitative Analysis:

1. Separation, purification and identification of compounds of binary mixture, derivative preparation and confirmatory tests.

Organic Synthesis:

2. Oxidation reaction
3. Reduction: Transfer hydrogenation reaction
4. Aldol condensation: Dibenzal acetone from benzaldehyde.
5. Friedel Craft's reaction
6. Preparation of p-amino azobenzene from aniline via diazoaminobenzene.
7. Preparation ofm-phenylene diamine from Nitrobenzene via m-dinitrobenzene and m- nitroaniline.
8. Preparation of benzidine from benzene involving benzidine rearrangement.

Quantitative Analysis:

9. Determination of the percentage of sulphur in the given organic compounds by Messenger's method.
10. Estimation of Glucose using Fehling's solution.
11. Determination of equivalent weight of the given carboxylic acid using Silver-salt method.
12. Determine percentage purity of the given carbonyl compound using hydroxylamine hydrochloride.
13. Determination of strength of known aniline solution by bromination using KBr-$KBrO_3$ mixture.

Extraction of Natural products:

14 Extration of caffeine from tea leaves.

15 Extraction of Eugenol from Cloves Oil

***MSDS -Compilation of MSDS of chemicals used by students in each experiment is compulsory**

RESEARCH SEMINAR

Course Code: CHY4108 **Credit Units: 01**

Objectives

A seminar is primarily an activity based academic event that is organized to provide the students a one to one and hands on experience on any aspect of their learning for research based activity. Prereq., graduate standing in chemistry/ biochemistry/ Forensic Sciences on consent of instructor. Seminar to acquaint new graduate students with departmental research (This one will be running through out first semesters on every Monday any Lecture, where normally Ph.D students /internal Faculties /external speakers will give talk on their research or other topic of their specialization).

The trainer has to make sure that the aspect covered is practically practiced by the participants. The evaluation will be done by Board of examiners comprising of the faculties.

Major Themes for Seminar

The seminar may be conducted on any of the following major themes:

- Nuclear Chemistry
- Modern trend in Inorganic Chemistry
- Modern trend in Organic Chemistry
- Modern trend in Physical Chemistry
- Nanotechnology and its application
- Polymer Chemistry
- Pharmaceuticals
- Food Technology
- Agriculture Chemistry
- Computational Chemistry
- Green Chemistry
- Any other relevant topics

These themes are merely indicative and other recent and relevant topics of study may be included.

Evaluation Scheme:

Attendance	Active Participation	Multiple Choice Questions/ Quiz	Solving the case/ Assignment/ Write up	Total
10	30	30	30	100

ANALYTICAL CHEMISTRY

Course Code: CHY4201 **Credit Units: 03**

Course Contents:

MODULE I: WET CHEMICAL METHODS OF ANALYSIS

Volumetric analysis –neutralization, precipitation, complexometric and redox titrations- theoretical titrations curves - theory of indicators; Gravimetric analysis, volatilization and precipitation methods-homogeneous precipitation; Colorimetric analysis - principles and applications- estimation of iron and nickel.

MODULE II: ELECTROANALYTICAL TECHNIQUES

Conductometry, and high frequency titrations; Potentiometry, pH-metry, Ion selective electrodes; Electrogravimetry and coulometry; Voltammetry –polarography, amperometric titrations and anodic stripping voltammetry; principles, practice and applications.

MODULE III: SEPARATION TECHNIQUES

Solvent extraction and Ion exchange techniques – principles and applications; Chromatographic techniques – adsorption chromatography, thin layer chromatography, gas chromatography, high performance chromatography, size exclusion chromatography; Supercritical fluid chromatography.

MODULE IV: RESEARCH BASED ANALYTICAL TECHNIQUE

Preparations of solutions of different strength and scales (molarity, molality, normality, formality, w/w, v/v ratio calculation exercises) buffers, gel apparatuses, native and SDS -PAGE gels, Isoelectric point

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

INDUSTRIAL CHEMISTRY

Course Code: CHY4202 **Credit Units: 03**

Course Objective:
This course is intended to give the students the knowledge of various aspects of industrial chemistry with the focus on preparation of different types of glass, cement, soaps and detergent. A student taking up this course should be able to understand the logic and chemistry behind the different types of catalytic process and catalyst.

Course Contents:

MODULE I: GLASS INDUSTRY
Introduction, classification of glass, basic raw materials of glass, manufacturing processes including chemical reactions, some special glasses: optical glass, coloured glass, fibre glass, laminate glass, safety glass, photosensitive glass, photochromatic glass, lead glass, borosilicate glass and glass wool.

MODULE II: CEMENT INDUSTRY
Types of cement, manufacture of Portland cement, composition, setting and hardening of cement, Mortars and concrete, gypsum, plaster of paris, estimation of silica, alumina, calcium oxide and sulphates in Portland cement.

MODULE III: SOAPS AND SYNTHETIC DETERGENTS
Manufacture of detergent, types of detergents, anionic, cationic, nonionic and amphoteric detergents, manufacture of soap, Liquid soap**.**

MODULE IV: HOMOGENEOUS AND HETEROGENEOUS CATALYSIS and CATALYTIC PROCESSES
Conversion, selectivity, contact time, time on stream, Kinetics of heterogeneous catalysis, adsoprtion, phase transfer catalysis, super acid catalysis, intramolecular catalysis, enzyme catalysis, semi-conductor catalysis and photocatalysis. Promoters, stabilizers, catalyst deactivation by poisoning, fouling and sintering, Cracking, reforming, alkylation, isomerization, hydrogenation/dehydrogenation, dehydrocyclisation, dehydrosulphurization, hydrocracking, oxidation, metathesis, carbonylation, polymerization, synthetic fuels, hydrogen generation.

Examination Scheme:

ORGANOMETALLIC CHEMISTRY

Course Code: CHY4211 **Credit Units:04**

Course Objective:
The main idea of this course is to give students a brief idea about Bioinorganic chemistry that examines the role of metals in biology. It includes the study of both natural phenomena such as the behaviour of metalloproteins as well artificially introduced metals, including those that are non-essential, in medicine and toxicology. Many biological processes such as respiration depend upon molecules that fall within the realm of inorganic chemistry. The discipline also includes the study of inorganic models or mimics that imitate the behaviour of metalloproteins. It also covers organometallic chemistry which is the study of chemical compounds containing bonds between carbon and a metal. Since many compounds without such bonds are chemically similar, an alternative may be compounds containing metal-element bonds of a largely covalent character. Organometallic chemistry combines aspects of inorganic chemistry and organic chemistry.

Course Content:
MODULE I: ROLE OF METAL IONS IN BIOLOGICAL SYSTEM
Elements of life: essential major, trace and ultratrace elements. Basic chemical reactions in the biological systems and the role of metal ions (specially Na^+, K^+, Mg^{2+}, Ca^{2+}, Fe^{3+}/2+, Cu2+/+, and Zn2+).Metal ion transport across biological membrane Na^+/K^+ion pump, ionophores. Toxic metal ions and their effects, chelation therapy (examples only), Pt and Au complexes as drugs (examples only), metal dependent diseases.

Module-II: Biological functions of haemoglobin, myoglobin and hemocynin, cytochromes and ferredoxins, carbonate bicarbonate buffering system and carbonicanhydrase. Biological nitrogen fixation, Photosynthesis: (Photosystem-I and Photosystem-II), chlorophyll and related elementary ideas

MODULE III: METALLOCENE
Metallocenes, Structure and synthesis of cyclopentadienyl complexes, Covalent vs Ionic bonding in metallocenes, Arene complexes

MODULE IV: REACTIONS IN ORGANOMETALLIC CHEMISTRY
Substitution reactions in carbonyl complexes, Oxidative addition and reductive elimination, Insertion and elimination, Nucleophilic and electrophillic attack of coordinated ligands, Synthesis of ferrocenes derivatives, carbonylate anion as nucleophile. Introduction to carbenes, types of carbenes (Fischer type and Schrock type carbene complexes, synthesis, structure, bonding and reactions of carbenes.

MODULE V: APPLICATIONS OF ORGANOMETALLICS IN CATALYSIS
(b) In Catalysis: Asymmetric hydrogenation; synthesis of acetic acid (Monsanto) Cativa process; Arylation/vinylation of olefins (Heck reaction); Wacker process (olefin oxidation); Asymmetric epoxidation.

MODULE- VI: METAL π-COMPLEXES
Metal carbonyl, structure and bonding, 18 elctron rule, vibrational spectra of metal carbonyls for bonding and structural elucidation, important reactions of metal carbonyls; preparation, bonding structure and important reaction of transition metal nitrosyl, dinitrogen and dioxgen complexes; tertiary phosphine as ligand.

INTRODUCTION TO LABORATORY SAFETY

Course Code: CHY4212 **Credit Units: 01**

Course Objective :

The basic goal of this course is to make sure students know about potential work hazards, how to recognize them, and how to protect themselves. This course is designed to help reduce possible accidents arising out of negligence. This introductory course in laboratory chemical safety is required for all entering chemistry graduate students. Topics to be covered include laboratory emergencies, chemical hazards, lab inspections and compliance, managing and working with chemicals, waste handling, case studies of university accidents.

Course Contents:

MODULE I: INTRODUCTION TO LABORATORY SAFETY

Risks in a Research Laboratory, Health Effects Due to "Hazardous" Chemical Exposure (How Does One Determine the Hazards Associated with Specific Chemicals, Exposure Routes, Toxicity Risk Assessment), Personal Protective Equipment (PPE) Proper Attire (Eye/Face Protection, Lab Coats, Gloves, Respirators, Disposal/Removal of PPE), Emergency Equipment Safety Showers/Eye Washes, Key Campus and Department Chemical Safety Contacts, Case Study: Dartmouth Chemical Poisoning (Key Lessons learnt).

MODULE II: LABORATORY EMERGENCIES: SPILLS AND FIRES

Handling the Accidental Release of Hazardous Materials, Notifications, Spill Containment and Clean-up, Leaking Gas Cylinders, Fires Classification, Fire Extinguishers (how they work, types), Risk Assessment, Flammable Hazards, Flammability Characteristics, Flammability Classes, Causes of Ignition, Reactive Hazards, Explosives, Case Study: University of Texas Austin Sodium Fire (Key Lessons learnt).

MODULE III: CHEMICAL HAZARDS

Chemical Hygiene Plan, The New Safety Data Sheets (SDS) versus the Old Material Safety Data Sheets (MSDS), Assessment of Chemical Toxicity, Toxic Hazards (Dose, Risk Assessment, Types of Toxins, Working with Highly Toxic Compounds (General Considerations, Planning, Precautions for Minimizing Exposure – Handling, In the Event of a Spill), General Considerations (Chemical Segregation, Transfer and Transport, Chemical Fume Hoods (Safety, Types, Operation), Other Types of Ventilation) Case Study: University of Wisconsin – $LiAlH_4$ Explosion (Key Lessons learnt).

MODULE IV: MANAGING AND WORKING WITH CHEMICALS

Working with Flammable Substances (Standard Operating Procedures), Working with Highly Reactive or Explosive Substances, Working with Compressed Gases (Parts of the Cylinder, Cylinder Pressure Regulator, Storage Guidelines, Transporting Cylinders, Handling Compressed Gas Cylinders) Working with Cryogenics (Health Hazards, Liquid N_2),Waste Handling. Characterization of Waste. Collection and Storage (Lids, Leaks, Labels, Location, Containers), Consequences of Mixing Incompatibles, Solid Wastes (Chemicals, Broken Glass, Sharps, Cylinders). Waste Handling, Characterization of Waste, Collection and Storage (Lids, Leaks, Labels, Location, Containers), Consequences of Mixing Incompatibles

Solid Wastes (Chemicals, Broken Glass, Sharps, Cylinders, Pick-up), Special Cases, Hazardous Waste Minimization, Case Study: the "UCLA Incident".

MODULE V: WORKING ON LABORATORY EQUIPMENTS

Working with Water (liquid)-dependent Equipment (Hazards, Proper Use, Heating Baths), Working with High Pressure Vacuum Pumps, Working with Stirring and Mixing Devices, Working with Heating Devices (Variacs, Oil, Salt, Sand Baths, Microwave Ovens), Ultrasonicators, Centrifuges and HPLCs. Laser classifications, Effects of lasers on skin and eyes, Protective eyewear, Enclosing laser beams, Examples of common mistakes and ways to avoid them, Non-beam

Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

hazards, Risk Assessment: when is it okay to violate specific safety rules? The importance of understanding, how things work, Case Study: Laboratory Equipment.

MODULE VI: BIOSAFETY, RADIATION, AND ANIMALS

Chemicals such as acrylamide & ethidium bromide, Pathogens, Biological waste handling, Recombinant DNA, Mammalian cell culture, Case Study.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

SPECTROSCOPY

Course Code: CHY4213 **Credit Units: 03**

Course Objective:
The course is designed to give students the basis of organic compound charachterization. The student will be able to analyse and interpret spectroscopic data collected by the methods discussed in the course. They will be able to solve problems related to the structure, purity and concentration of chemicals and to study molecular interactions by choosing suitable spectroscopic methods and interpreting corresponding data.

Course Contents:
MODULE I: Ultra-violet and Visible Spectroscopy:
Principles of electronic spectroscopy, Absorption Law's, Type of electronic transitions, Effect of solvent on electronic transitions, Chromophores &Auxochromes, Ultraviolet bands of carbonyl compounds, unsaturated carbonyl compounds, dienes, conjugated polyenes. Fieser-Woodward rules for conjugated dienes and carbonyl compounds. Qualitative applications of UV-Vis spectroscopy.

MODULE II: INFRARED SPECTROSCOPY
Principle of IR spectroscopy, Modes of vibrations, Hook's law and calculation of frequency for different bonds. Fundamental vibrations and selection rule. Characteristic vibrational frequencies of common organic compounds. Effect of hydrogen bonding and solvent effect on vibrational frequencies, overtones, combination bands and Fermi resonance. Fingerprint region. Introduction to Raman spectroscopy. Applications of IR and Raman Spectroscopy in organic chemistry.

MODULE III: Nuclear Magnetic Resonance (NMR) Spectroscopy:
General introduction, chemical shift and factors effecting it, spin-spin coupling, shielding – deshielding mechanism, chemical and magnetic equivalence or non-equivalance chemical shift values and correlation of protons present in different groups in organic compounds. Proton exchange (proton on N, O and S atom), Karplus-relationship of coupling constant with dihedral angle. Simplification of complex spectra-by double resonance, contact shift reagents, D_2O shake. Nuclear Overhauser Effect (NOE). Determination of impurity by NMR, Principle and introduction to C-13 NMR, F-19, P-31, DEPT and 2-D NMR, Strcutrue determination by NMR.

MODULE IV: MASS SPECTROMETRY
Introduction, ion production—Electron ionization (EI), Chemical Ionization (CI), Fast atom bombardment (FAB) and Matrix Assisted Laser Desorption Ionization (MALDI), factors affecting fragmentation, ion analysis, and ion abundance. Mass spectral fragmentation of organic compounds, common functional groups, Molecular ion peak, Base peak, Isotopic peaks, Meta-stable peak, McLafferty rearrangement, ortho effect, Determination of molecular weight and molecular formula: Nitrogen Rule, hydrogen deficiency index. Introduction to GCMS, LCMS and HRMS. Combined structural elucidation problems based on IR, UV, NMR and mass spectral data.

Examination Scheme:

ANALYTICAL CHEMISTRY LAB

Course Code: CHY4206 **Credit Units: 02**

Minimum 10 Experiments to be performed

Chromatography

1. Estimation of zinc and magnesium in the given mixture solution against EDTA (Disodium salt) solution
2. Thin-layer chromatography-separation of nickel, manganeses, cobalt and zinc.
3. Separation and identification of the sugars present in the given mixture of glucose, fructose and sucrose by paper chromatography and determination of Rf values.
4. Separation of artificial colorants in confectionary using TLC.
5. Extraction and Determination of caffeine from tea leaves

Colorimetry

6. To verify Beer-Lambert's Law for potassium permanganate solution and hence to determine the molar extinction coefficient and unknown concentration of given sample colorimetrically
7. To verify the Beer-Lamberts Law and determine the concentration of given dye solution colorimetrically.
8. To estimate the amount of D-glucose in given solution colorimetrically.

Quantitative Analysis

9. Estimation of amines/phenols using bromate bromide solution/or acetylation method.
10. Determination of lodine and Saponification values of an oil sample.
11. To determine the acid value of given oil
12. Determination of protein content of wheat flour.

***MSDS -Compilation of MSDS of chemicals used by students in each experiment is compulsory**

INDUSTRIAL CHEMISTRY LAB

Course Code: CHY4207 **Credit Units: 01**

Minimum 10 Experiments to be performed

Analysis of Cement

1. Determination of silica content from given sample

Analysis of polymers

2. Determination of Acid Values of plastic material.
3. Determination of Saponification value of plastic material.
4. Determination Iodine value of a plastic material.
5. Determination of hydroxyl Value of plastic material.
6. Determination of Carbonyl Value of plastic material.
7. Determination of Molecular Weight of a polymer.
8. Determination of Capacity of cation exchange resin.
9. Determination Capacity of an anion exchange resin.
10. Determination of glass transition temperature of plastic.

Preparation of polymers

11. Preparation of Urea Formaldehyde resin and Phenol Formaldehyde resin.
12. To synthesize and hydrolyse Nylon 6:6/polyacrylic acid/polyaminde

Water Analysis

13. Determination ofTotal dissolved solids
14. Determination ofCarbonate and non-carbonate hardness by EDTA
15. Determination ofDissolved oxygen, BOD, COD
16. Determination ofTurbidity

Preparation of Dyes (methyl orange, bismark brown**)**
Preparation of Cosmetics (shampoo, lipstick, detergent**)**
Preparation of Drugs(Paracetamol and Aspirin)

***MSDS -Compilation of MSDS of chemicals used by students in each experiment is compulsory**
Examination Scheme:

TERM PAPER

Course Code: CHY4231 **Credit Units: 01**

Objectives

The objective of this course is to judge the understanding as well as application of the knowledge gained by the students. The aim of the term paper is to provide the students with an opportunity to further enhance their knowledge in a sector of their choice by undertaking a significant practical unit of examining and analyzing various aspects of Chemistry & its application at a level commensurate with the learning outcomes of the various courses taken up them in the ongoing semester.

A term paper is primarily a record of intelligent reading in several sources on a particular subject. The students will choose the topic at the beginning of the session in consultation with the faculty assigned.

Guidelines:

1. The term paper will be related to the contemporary research issue and the topic will be given by the department.

2. The presentation of the term paper is scheduled to be held before the commencement of Semester examinations.

3. The paper will carry 100 marks that will be marked on the basis of understanding and organization of content based on the literature review. The Bibliography shall form an important part of the paper.

4. Examples of a few broad areas for term paper (List is indicative, not exhaustive)

- Inorganic chemistry
- Organic chemistry
- Physical chemistry
- Green chemistry
- Agricultre chemistry

Evaluation Scheme

Organisation and relevance of content	Literature Review	Bibliography	Presentation	Total
30	30	20	20	100

NATURAL PRODUCTS AND HETEROCYCLIC CHEMISTRY

Course Code: CHY4325 **Credit Units: 03**

Course objective: The course provides an understanding of important natural products. Using selected examples, this course describes the process of identification and isolation of natural products from natural sources, their chemical synthesis and structure elucidation. The course gives a broad introduction to heterocyclic chemistry. Emphasis is given on the most important heterocyclic systems, such as coumarines, indoles, pyrimidines, imidazoles, aziridines and oxiranes etc. For each group, ring synthesis, chemical properties and characteristic reactions will be discussed.

Course Contents:

MODULE I: TERPENOIDS AND CAROTENOIDS

Classification, nomenclature, occurrence, isolation, general methods of structure determination, isoprene rule. Structure determination, stereochemistry and synthesis of the following representative molecules: Citral, α-Terpeneoland β-Carotene

MODULE II: ALKALOIDS

Definition, nomenclature and physiological action, occurrence, isolation, general methods of structure elucidation, degradatin, classification based on nitrogen heterocyclic ring, role of alkaloids in plants. Structure, stereochemistry and synthesis of the following: Coniine, Nicotine, Atropine, and Quinine.

MODULE III: HETEROCYCLIC - I

Introduction, classification, nomenclature of three, four, five and six-membered rings. Methods of synthesis and chemical reactions of aziridines, oxiranes, thiiranes, azetidines, oxetanes. Methods of Synthesis and chemical reactions with emphasis on the mechanism of electrophilic substitutionof pyrrol, thiophene and furan. Synthesis and reactions of pyridine with emphasis on nucleophilic substitution reactions.

MODULE IV: HETEROCYCLIC – II

Introduction to condensed five and six membered heterocycles; preparation and reactions of indole, quinoline and isoquinoline with special reference to Fischer-indole synthesis, Skraup synthesis and BischierNapieralski synthesis. Synthesis and chemical reactions of five membered ring with two heteroatoms; pyrazole, imidazole, oxazole, thiazole, isothiazole, and benzofused analogue like coumarins, thiocoumarins, phenazine, phenothiazines, 1,4 and 1,5-benzodiazepines.

DRUGS AND DYES

Course Code: CHY4304 **Credit Units: 04**

Course Objective: At the end of this course students must acquire a good knowledge about the various drugs their active constituents, their pharmacological actions and therapeutic uses. Beside drugs they will learn about various dyes used in day to day life, their properties and applications.

Course Content:

MODULE I: INTRODUCTION TO DRUGS

Definition of drug (WHO), classification of drugs, nomenclature of drugs, stereochemical aspects of drugs, definitions of terms commonly used in the chemistry of drugs, routes of drug administration and different dosage forms and applications

MODULE II: MECHANISM OF ACTION, STRUCTURE AND SYNTHESIS OF DRUGS

Sulphonamides : Sulphathiazole, Sulphadiazine(any two)
Antiseptics : Iodoform, Dettol
Antileprotic drugs : Dapsone (DDS), Acedapsone (DADDS)
Anticancer agents : Alkylating agents
CardiovascularDrugs : Amyl nitrate, Methyldopa
Antipyretics&Analgesics: Novalgin, Paracetamol
Antimalarials :Chloroquine ,Primaquine,Mepacrine
Anti diabetic : Tolbutamide
Antitubercular : p-amino salicylic acid, Ethambutol

MODULE III: INTRODUCTION TO DYES

Historical development of synthetic Dyes - Introduction, Nomenclature, classification based on structure & mode of applications of fibres.Structural features of a dye (chromophores and auxochromes), bathochromic and hypsochromic effects, diazotisation and coupling, colour and chemical constitution (Witt's theory, Armstrong theory and Modern theory). Dye intermediates- unit, batch & continuous process in the preparation of dye intermediates,

MODULE IV: STRUCTURE AND PREPARATION OF DYES

Nitro Dyes : Picric acid, Martius yellow, Naphthol yellow S
Nitroso Dyes : Fast green O, Naphthol green Y
Azo Dyes : Methyl orange, Methyl red, Congo Red
Phthaleins : Phenolphthalein
Phthalocyanines: Copper phthalocyanine
Xanthenes : Fluorescein, Eosin, Mercurochrome
Rhodamines : Rhodamine B
Thiazine Dyes : Methylene blue
Cyanine Dyes : Quinoline blue
Antraquinone Dyes: Alizarin
Indigoids : Indigo (Indigotin)
Thioindigos : Thioindigo
Azine Dyes : Safranine T

Action of light on dyes and dyed fibres, Factors affecting fastness of dyed fibres General consideration, fluorescence, phototropy, mechanism of fading.

ADVANCED NATURAL PRODUCTS CHEMISTRY

Course Code: CHY4305 **Credit Units:03**

Course Objective: The main idea of this course is the give the students details of natural product chemistry, which includes the study of Vitamins, alkaloids, terpenes and steroids etc. These plays a key role in our day to day life. The course covers the importance of these naturally occurring materials and their applications in chemistry, biology and medicine. The course will alos includes the invited lectures on recent advances in natural product chemistry and it gives a reasonable good overview of the naturally occurring chemicals and their important reactions, their applications etc.

Course Content:

MODULE I: NATURAL PRODUCTS AND THEIR BIOSYNTHETIC PATHWAYS

General classification of natural products, their isolation and characterisation and biosynthesis of common plant products; Biosynthesis pathways for natural products using co-enzymes and enzymes; Synthesis of selected natural products based on genetic classification – fatty acid derivatives and related compounds, general biogenesis and synthesis of cis jasmone, methyl jasmonate, prostaglandins, exaltone and muscone.

MODULE II: VITAMINS

Vitamins: Classification, occurrence, chemistry of Vitamins A, C and E, structure elucidation and synthesis, deficiency syndromes,

MODULE III: ALKALOIDS

Alkaloids, defination, Isolation, Classification (define different categories of alkaloids with specific examples, their medicinal uses, synthesis).Drugs (cocaine, opiates, quinine, vincristine, curare, mescaline, etc.) and toxins (nicotine, lupinines, strychnine, tetrodotoxin, etc.Introduction, 2. Simple Alkaloids I: Pyrrole Derivatives 3. Simple Alkaloids II: Piperidine Derivatives 4. Aromatic Alkaloids I: Simple Derivatives 5. Aromatic Alkaloids II: More Complex Derivatives 6. The Indole Alkaloids 7.Miscellaneous Alkaloids with Interesting Bioactivities.

MODULE IV: TERPENES AND STEROIDS

Classification and biosynthesis of mono- sesqui-, di- and triterpenoids and steroids.Acetyl CoA, Mevalonic acid, acetoacetyl CoA, squalene to lanosterol, Cholesterol to estradiol, diosgenin and its utility in hormone synthesis.

MODULE V: GENERAL CHEMISTRY OF THE FOLLOWING COMPOUNDS

Cholesterol, Artemisinin, Gibbereline A3, Azadirachtin.

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE

ADVANCED NANOCHEMISTRY

Course Code: CHY4308 **Credit Units:03**

Course Objective: This course is intended to give the students' knowledge of advances in nanochemistry and introduction to ionic liquids. This course will help the student understand superplasticity and its industrial Applications. A knowledge of introductory level nanochemistry is required.

Course Content:

MODULE-I: SIZE EFFECTS ON STRUCTURE AND MORPHOLOGY OF NANOPARTICLES

Fundamental Properties - Size Effects on Structure and Morphology of Free or Supported Nanoparticles - Size and Confinement Effects - Fraction of Surface Atoms - Specific Surface Energy and Surface Stress - Effect on the Lattice Parameter - Effect on the Phonon Density of States - Nanoparticle Morphology - Equilibrium Shape of a Macroscopic Crystal - Equilibrium Shape of Nanometric Crystals - Morphology of Supported Particles.

MODULE-II: SUPERPLASITICITY AND REACTIVITY OF METAL NANOPARTICLE

Superplasticity – Introduction – Mechanism - Superplastic Nanostructured Materials - Industrial Applications. Reactivity of Metal Nanoparticles - Size Effects-Structural Properties - Electronic Properties - Reactivity in Chemisorption and Catalysis of Monometallic Nanoparticles - Support Effects - Alloying Effects - Effect of Surface Segregation - Geometric Effects -Electronic Effects - Preparation and Implementation in the Laboratory and in Industry.

MODULE-III: SUPERCRITICAL FLUIDS

Supercritical Fluids –Introduction – Physicochemical Properties - Solubility - Viscosity - Diffusion - Thermal Conductivity - Applications - Purification and Extraction - Synthesis.

MODULE-IV: FEATURES OF NANOSCALE GROWTH

Specific Features of Nanoscale Growth – Introduction - Thermodynamics of Phase Transitions -Dynamics of Phase Transitions - Thermodynamics of Spinodal Decomposition - Thermodynamics of Nucleation – Growth - Size Control - Triggering the Phase Transition- Application to Solid Nanoparticles - Controlling Nucleation - Controlling Growth - Controlling Aggregation. Stability of Colloidal Dispersions - Breaking Matter into Pieces.

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE
Weightage(%)	15	5	5	5	70

MEDICINAL CHEMISTRY

Course Code: CHY4310 **Credit Units: 03**

Course objective: This course is intended to provide students with chemical principles that are required to understand the action and behavior of drug compounds and hence the relationship between the structure and stereochemistry of a compound and its chemical and therapeutic properties, and thus the chemical considerations in drug design: size, physico-chemical properties and ADME (absorption, distribution, metabolism, and excretion).

Course Contents:

MODULE I: DRUG DEVELOPMENT

Drug development: Lead modification. (a) Identification of active part -Pharmacophore (b) Fundamental group modification (c) Structure-activity relationship (d) Structure modification to increase potency and therapeutic index (i) Homologation ii) Chain branching (iii) Ring chain transformations (iv) Bioisosterism. Drug development process: (a) Pre-formulation, product development (b) Preclinical studies; Acute toxicity, sub acute toxicity, chronic toxicity, LD_{50}, ED_{50}, pharmacodynamicsutagenecity and reproductive studies.

MODULE II: PHARMACOKINETICS

Basic principles of pharmacokinetics including absorption, distribution, metabolism and excretion of drugs and metabolites in the human body, important pharmacokinetic parameters in defining drug therapeutics, mathematical approach to pharmacokinetic modeling.

MODULE III: PHARMACODYNAMICS

Introduction, elementary treatment of enzyme stimulation, enzyme inhibition, sulphonamides, membrane active drugs, drug metabolism, biotransformation, significance of drug metabolism in medicinal chemistry. Therapeutic index, explanation of quantal dose, graded dose, dose-effect curves, efficacy, potency, margin of safety

MODULE IV: ANTIBIOTICS

Definition, characteristics, classification, synthesis and therapeutic uses of Penicillin, Ampicillin, Amoxicillin, Chloramphenicol, Cephalosporin, Tetracycline and Streptomycin

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE
Weightage(%)	15	5	5	5	70

ENVIRONMENTAL CHEMISTRY

Course Code: CHY4321 **Credit Units: 03**

Course Objective: This course is intended to provide students with knowledge of key themes, theories and problems and describe important chemical reactions in the atmosphere and in water, including important chemistry in connection with air pollution, water pollution, and case studies of many environmental disasters.

Course Contents:

MODULE I: CHEMISTRY AND THE ENVIRONMENT

Chemistry and the environment - environmental pollution - causes - pollutants – air pollution - effects of air pollution: Environmental fate of pollutants – transformation process - bioconcentration - fate of air, water and soil pollutants

MODULE II: WATER POLLUTION

Water pollution - water quality parameters - turbidity, colour, pH, acidity, alkalinity, solids, hardness, chlorides, residual chlorine, sulphates, fluorides, phosphates, iron and manganese, DO, BOD, COD, nitrogen, grease, volatile acids, gas analysis.

MODULE III: INDUSTRIAL POLLUTION

Cement, sugar, distillery, drug, paper and pulp, thermal power plants, nuclear power plants, metallurgy. Polymers, drugs etc.

Environmental disasters – Cherbonyl, Three Mile Island, Seveso and minamata disasters, Japan tsunami

MODULE IV: BIOLOGICAL ACTIVITY

Biological activity - biodegradation of carbohydrates, proteins, fats and oil, detergents, pesticides; Metabolic fate of pollutants - adsorption – distribution -metabolism - excreation.

MODULE V: ENVIRONMENTAL TOXICOLOGY

Toxic heavy metals**:**Mercury, lead, arsenic and cadmium, Causes of toxicity. Bioaccumulation, sources of heavy metals, Chemical speciation of Hg, Pb, As, and Cd. Biochemical and damaging effects. Toxic Organic Compound**:**Pesticides, classification, properties and uses of organochlorine and ionospheres pesticides detection and damaging effects.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

POLYMER TECHNOLOGY

Course Code: CHY4311 **Credit Units:03**

Course objective: This course is designed to familiarize students with the various polymer characterization and manufacturing techniques for converting polymer feed stocks into plastic end products. It involves a study of various plastics processing techniques. Students will become familiar with specialty polymers and their industrial uses, and design factors to create materials with desirable end-use properties

Course Contents:

MODULE I: POLYMER PROCESSING
Plastic Technology: Extrusion, injection molding, blow molding, compression molding, thermoforming, rotational molding, casting.Fiber Technology- Textile and fabric properties, spinning, fiber after-treatments.Elastomer Technology- Vulcanization, reinforcement, elastomer properties and compounding.Recycling of polymers Classification of polymer recycling processes. Waste polymer recovery, sortation, microsortation, polymer reprocessingand Polymer incineration

MODULE II: POLYMER BLENDS AND ALLOYS
Definition, Polymer Blends, compatibilisation, Polymer Blends, Industrial applications of polymer blends.

MODULE III: SPECIALTY POLYMERS
Liquid Crystal Polymers (LCP): Smectic, nematic, cholestric crystals, thermotropic main chain LCP, side chain LCP, chiral nematic LCP, properties of commercial LCP's. Electroactive polymers: Filled polymers, conducting polymers- doping, conducting mechanism, EMI shielding, applications- rechargeable batteries, sensors, photoconductive polymers. Ionic Polymers: Ionic crosslinking, ion exchange, hydrophilicity, ionomers, polyelectrolytes, applications, Synthetic Polymeric membranes- membrane preparation, membrane modules, applications, High temperature and fire resistant polymers, Hydrogels, smart polymers, Dendritic polymers- their applications.Biomedical polymers: Contact Lens, Dental Polymers, Artificial heart, Kidney and skin cells Biobased polymers: PLA, PCL

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE
Weightage(%)	15	5	5	5	70

NON–CONVENTIONAL ENERGY SOURCES

Course Code: CHY4312 **Credit Units:03**

Course Objective: A detailed exposition of the course for the student, opting for Applied Chemistry is so vitally important for a clear understanding of recent intricate theories of non-conventional sources of energy.

Course Contents:

MODULE I: SOLAR ENERGY
Heat Transfer in Renewable Energy Systems - conduction, convection and radiation, Heat transfer and engineering concepts to the renewable energy systems, Role and potential of new and renewable source, the solar energy option, Environmental impact of solar power, physics of the sun, Spectral distribution, the solar constant, radiation on titled surface/earth, instruments for measuring solar radiation. Application of solar energy and solar photovoltaic system

MODULE II: BIO-GAS
Raw materials, Properties/characteristics of bio gas, Principles of Bio-Conversion; Photosynthesis, Anaerobic/aerobic digestion, types of Bio-gas digesters, gas yield, combustion, Transportation of bio gas, bio gas plant technology & status, Biomass cogeneration Energy recovery from urban waste, Power generation from liquid waste, Bio gas applications.

MODULE III: GEOTHERMAL AND WIND ENERGY
Structure of earth's interior, earthquakes & volcanoes, Geothermal resources, Hot springs, Steam ejection, Principal of working, Types of geothermal station with schematic representation, Applications. Properties of wind, Availability of wind energy in India, wind velocity, Wind machine fundamentals; types of wind machines and their characteristics, Horizontal and Vertical axis wind mills, Elementary design principles, Coefficient of performance of a wind mill rotor, Aerodynamic considerations in wind mill design, Recent development and applications.

MODULE IV: OCEAN AND HYDROGEN ENERGY
Principle of ocean thermal energy conversion (OTEC), setting of OTEC plants, thermodynamic cycles. Tidal and wave energy: Fundamentals of tidal power, Potential and conversion techniques, mini-hydel power plants. Use of tidal energy, Limitations of tidal energy conversion systems. Properties of hydrogen in respect of it's use as source of renewable energy, Sources of hydrogen, Production of hydrogen; electrolysis of water, thermal decomposition of water, thermo chemical production bio-chemical production. Applications of hydrogen energy.

Examination Scheme:

INDUSTRIAL WASTE AND WATER TREATMENT

Course Code: CHY4313 **Credit Units:03**

Course Objectives: This course will give the basic understanding of the chemical principles involved in water and wastewater treatment. It presents the basic chemistry and treatment methodologies used in drinking water and wastewater operations. The students would be able to characteristics and treatment of industrial waste, advanced methods of treatment waste and disposal, reuse and recovery of waster from various industries. A brief introduction to environmental Impact assessment has also been added to create general awareness.

Course Contents:

MODULE I: **AN INTRODUCTION TO SOURCE, CHARACTERISTICS AND TREATMENT OF INDUSTRIAL WASTE**
Undesirable waste characteristics, sources and characteristics of waste water, industrial waste survey, waste characteristics - estimation of organic content, water reuse and in-plant waste control, idea of different technologies for the treatment of industrial waste water and the basis for the selection of treatment technology.

MODULE II: **TREATMENT OF INDUSTRIAL WASTES**
Different steps in the treatment of industrial waste (equalization, neutralization, sedimentation, oil separation, flotation, coagulation), sources and removal of heavy metals e.g. As, Ba, Cd, Cu, F, Fe, Rb, Mn, Hg, Ni, Se, Ag & Zn)

MODULE III: **ADVANCE WATER TREATMENT OF INDUSTRIAL WASTE**
Aeration, air stripping of volatile organics (VOC), biological oxidation - removal of organics (sorption, stripping, biodegradation), nitrification and de-nitrification. Lagoons and stabilization basins, membrane processes, trickling filtration, adsorption, ion exchange, chemical oxidation, sludge dewatering and disposal.

MODULE IV: **WASTE WATER REUSE AND RECOVERY**
Treatment, disposal, reuse and recovery of trade waste from (1) Textile Manufacture (2) Distilleries (3) Sugar (4) Paper and Pulp mills (4) Tanneries (5) Food Processing industries (6) Fertilizer Industry.

MODULE V: **ENVIRONMENTAL IMPACT ASSESSMENT**
Introduction to EIA, impact assessment methodologies, environmental inventory, environmental impact assessment (planning and management), environmental indices and indicators for describing the affected environment, EIA guidelines, introduction to environmental impact statement.

Examination Scheme:

NUCLEAR CHEMISTRY

Course Code: CHY4314 **Credit Units: 03**

Course Objective: This course is designed to provide basic information of Radiation and Nuclear chemistry; requirements, methods of preparation, uses of Radioelements. This should improve a student's knowledge of types of radioactive decay, natural decay series, nuclear models, nuclear properties, instrumentation and Introduction to health

Course Contents:

MODULE I: INTRODUCTION TO RADIOACTIVITY
Discovery of radioactivity, α, β and γ radiations, the radioactive series, radioactive decay, modes of decay, the n/p ratio, odd even rule, artificial radioactivity, transmutation of elements, the G.M counter

MODULE II: CHEMISTRY OF RADIOACTIVE ELEMENTS
Positions of radioactive elements in periodic table, trans-uranides and trans-actinides, super heavy elements; nomenclature & predicted chemistry, the Seaborg model, radiation dosimetry, radiolysis of aqueous solutions

MODULE III: USES OF NUCLEAR ISOTOPES
Introduction to nuclear medicine, positron emission tomography (PET) , radiocarbon dating and its uses, nuclear reactors, uses of heavy water in nuclear reactors, Trace analysis of elements and compounds - neutron activation analysis, isotope dilution analysis. Nuclear waste and its environmental effect

MODULE IV: NUCLEAR MODELS
Liquid-drop model, electron shell model, nuclear reactions, fission and fusion, cold fusion, idea about nuclear spin and its application in NMR, nuclear splitting, Zeeman effect and stark effect (only definition and qualitative explanation)

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE
Weightage(%)	15	5	5	5	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, A: Attendance EE: End Semester Examination

Suggested Readings:

- Essentials of Nuclear Chemistry, H. J. Arnikar, 4th Edition Wiley Eastern (1987).
- Chemical Applications of Radioisotopes, H. J. M. Bowen. Buttler and Tanner (1969).
- Introduction of Nuclear and Radiochemistry, G Friedlander, T. W. Kennedy, E. S.
- Macias and J. M. Miller, 3rd Edition, John Wiley (1981).

FOOD TECHNOLOGY

Course Code: CHY4315 **Credit Units:03**

Course objective: The contents have been drawn-up to accommodate the widening horizons of the discipline of Food Technology. They reflect the current changing needs of the students. This will create awareness among the students about the fundamentals of food and nutrition science involved in our everyday life

Course Contents:

MODULE I: INTRODUCTION TO FOOD

Carbohydrates: Structure and functional properties of mono- oligo-polysaccharides including starch, cellulose, pectic substances and dietary fibre; Proteins: Classification and structure of proteins in food; Lipids: Classification and structure of lipids, Rancidity of fats, Polymerization and polymorphism; Pigments: Carotenoids, chlorophylls, anthocyanins, tannins and myoglobin; Food flavours: Terpenes, esters, ketones and quinones; Enzymes: Specificity, Kinetics and inhibition, Coenzymes, Enzymatic and non-enzymatic browning; Nutrition: Balanced diet, Essential amino acids and fatty acids, PER, Water soluble and fat soluble vitamins, Role of minerals in nutrition, Antinutrients, Nutrition deficiency diseases.

MODULE II: FOOD MICROBIOLOGY

Characteristics of microorganisms; Microbial growth in food: Intrinsic and extrinsic factors, Growth and death kinetics, serial dilution method for quantification; Food spoilage: Contributing factors, Microbial spoilage of milk and milk products, meat and meat products; Foodborne disease: Toxins; Fermented food: Buttermilk, yoghurt, cheese, sausage, alcoholic beverage, vinegar, sauerkraut and soya sauce.

MODULE III: FOOD PRODUCTS TECHNOLOGY

Processing principles: Canning, chilling, freezing, dehydration, control of water activity, CA and MA storage, fermentation, hurdle technology, addition of preservatives and food additives, Food packaging, cleaning in place and food laws; Grain products processing: Milling of rice, wheat, and maize, production of bread, biscuits and breakfast cereals, Solvent extraction, refining and hydrogenation of oil; Milk and milk products processing: pasteurized and sterilized milk, cream, butter, ghee, ice-cream, cheese and milk powder; Animal products processing

MODULE IV: FOOD CHEMICAL ENGINEERING

Mass and energy balance; Momentum transfer: Flow rate and pressure drop relationships for Newtonian fluids flowing through pipe, Characteristics of non Newtonian fluids - generalized viscosity coefficient and Reynolds number, Flow of compressible fluid, Flow measurement, Pumps and compressors; Heat transfer: Heat transfer by conduction, convection, radiation, boiling and condensation, heat exchangers; Mass transfer: Molecular diffusion and Fick's Law, Steady state mass transfer, Convective mass transfer;

MODULE V: FOOD MECHANICAL ENGINEERING

Mechanical operations: size reduction of solids, high pressure homogenization, filtration, centrifugation, settling, sieving, flow through porous bed, agitation of liquid, solid-solid mixing, and single screw extrusion; Thermal operations: Energy requirement and rate of operations involved in process time evaluation in batch and continuous sterilization, evaporation of liquid foods, hot air drying of solids, spray and freeze-drying, freezing and crystallization.

RENEWABLE ENERGY CONVERSION SYSTEMS

Course Code: CHY4322 **Credit Units: 03**

Course Objective:
Course provides an introduction to different renewable energy sources. It analyses the full range of renewable energy supplies needed for modern economies. The course includes power from sun, wind, bio, tidal, ocean, geo and hydro.

Course Contents:
Module I: Introduction to Renewable Energy
Renewable and Non-Renewable Energy, World energy scenario; Fossil fuel resources - estimates and duration; India's energy scenario; Synergy between energy and environment, global environment issues, greenhouse gas emission, global warming, green energy solutions, technical and social implications of renewable energy

Module II: Solar Concepts
Introduction, Sun as the source of radiation, Earth and Solar constant, Extra-terrestrial solar radiation, components of radiation, effects of earth's atmosphere, Introduction to solar PV, Introduction to solar Thermal.

Module III: Biofuels, Wind Energy
Biofuels- Definition, generations and types
Wind-Characteristics, Sources of wind, components of wind turbines, advantages and environmental aspects of wind energy

Module IV: Hydro Energy, Tidal Energy
Hydro- Principles, hydro-turbines, social and environmental aspects
Tidal- The nature of the resource, physics, power generation, technical factors, environmental factors, tidal energy potential, tidal barrage, tidal stream, tidal current turbines.

Module V: Geothermal, OTEC
Geothermal- Principles, suitable sites and criteria, Advantages and disadvantages,
OTEC- Principles, Open and closed systems.

Examination Scheme:

Components	CT	Assignment	V/Q	Attendance	EE
Weightage (%)	15	5	5	5	70

Suggested Readings:
- Renewable energy resources – J. W. Twidell
- Renewable energy engineering and technology-edited by V. V.N. Kishore
- Wind Energy Comes of Age, Paul Gipe, John Wiley & Sons Inc.
- Directory, Indian Windpower 2004, CECL, Bhopal.
- Solar Energy: Fundamentals, design, modeling and applications, Authored by G. N. Tiwari

INORGANIC CHEMISTRY LAB

Course Code: CHY4324 **Credit Units:02**

(Minimum 10 experiments to be performed)

Quantitative and Qualitative Analysis of following:

1. Ores analysis (oxides and carbonate ores)
2. Nickel/Copper

Estimation of following:

3. Active CaO in lime
4. Chlorine in bleaching powder
5. Lead content in red lead

Preparation and Characterizations/study by spectral methods

6. Trialkoxyboanes.
7. Tin (IV) chloride
8. Sodium tetrathionate
9. Cr (III) complexes.$[Cr(H_2O)_6]NO_3.3H_2O$,$[Cr(H_2O)_4Cl_2]Cl.2H_2O$,$[Cr(en)_3]Cl_3$, $[Cr(acac)_3]$.
10. Fe(II) chloride and its application as catalyst in Friedel-Craft reaction
11. Ferrocene
12. Kinetic study of Cr(III) with a multidentate ligand (EDTA)

Qualitative Inorganic Semi-micro Analysis

13. Detection of atleast four cations and anion in a mixture of salts.

***MSDS -Compilation of MSDS of chemicals used by students in each experiment is compulsory**

Examination Scheme:

IA				EE	
A	**PR**	**LR**	**V**	**PR**	**V**
5	10	10	5	35	35

Note: IA –Internal Assessment, EE- External Exam, PR- Performance, LR – Lab Record, A-Attendance, V – Viva.

Suggested Readings:

SUMMER INTERNSHIP / STUDY ABROAD PROGRAMME

Course Code: CHY4335 **Credit Units: 6**

Objectives

The objective of this course is to judge the understanding as well as application of the knowledge gained by the students. The aim of the internship is to provide the students with an opportunity to further enhance their knowledge in a sector of their choice by undertaking a significant practical unit of examining and analyzing various aspects of Chemistry & its application at a level commensurate with the learning outcomes of the various courses taken up them in the ongoing semester.

A summer internship is primarily a record of intelligent reading and research on a particular subject. The students will choose the topic at the beginning of the session in consultation with the faculty assigned.

Guidelines:

1. The internship will be related to the contemporary research issue and the topic will be given by the department.
2. The presentation of the term paper is scheduled to be held before the commencement of Semester examinations.
3. The paper will carry 100 marks that will be marked on the basis of understanding and organization of content based on the literature review. The Bibliography shall form an important part of the paper.
4. Examples of a few broad areas for term paper (List is indicative, not exhaustive)

- Inorganic chemistry
- Organic chemistry
- Physical chemistry
- Green chemistry
- Agricultre chemistry

Marking Scheme:

Committee (50)			Supervisor's Assessment: Regularity and Quality of Work (50)	Total (100)
Presentation: Contents + Delivery (20)	Viva: (Q & A) (20)	Dissertation: Content + Formatting (10)		

Evaluation component of the Supervisor is 50% and the remaining 50% by committee

MAJOR PROJECT

Course Code: CHY4437 **CreditUnits: 10**

GUIDELINES FOR PROJECT FILE AND PROJECT REPORT

Research experience is as close to a professional problem-solving activity as anything in the curriculum. It provides exposure to research methodology and an opportunity to work closely with a faculty guide. It usually requires the use of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation.

Research is genuine exploration of the unknown that leads to new knowledge which often warrants publication. But whether or not the results of a research project are publishable, the project should be communicated in the form of a research report written by the student.

Sufficient time should be allowed for satisfactory completion of reports, taking into account that initial drafts should be critically analyzed by the faculty guide and corrected by the student at each stage.

PROJECT FILE

The Project File may be a very useful tool for undertaking an assignment along-with a normal semester, an exploratory study, sponsored projects, a project undertaken during summer period or any other period as per curriculae where the researcher is working with a company/organization. The project/ assignment may also be a part of the bigger research agenda being pursued by a faculty/ institution/ department

The Project File is the principal means by which the work carried out will be assessed and therefore great care should be taken in its preparation. This file may be considered in continuous assessment.

In general, the File should be comprehensive and include:

- A short account of the activities that were undertaken as part of the project;
- A statement about the extent to which the project has achieved its stated objectives;
- A statement about the outcomes of the evaluation and dissemination processes engaged in as part of the project;
- Any activities planned but not yet completed as part of the project, or as a future initiative directly resulting from the project;
- Any problems that have arisen and may be useful to document for future reference.

PROJECT REPORT

The Project Report is the final research report that the student prepares on the project assigned to him. In case of sponsored project the lay out of the project could be as prescribed by the sponsoring organization. However, in other cases the following components should be included in the project report:

- **Title or Cover Page**
  The title page should contain Project Title; Student's Name; Programme; Year and Semester and Name of the Faculty Guide.
- **Acknowledgement(s)**
  Acknowledgment to any advisory or financial assistance received in the course of work may be given. It is incomplete without student's signature.
- **Abstract**
  A good"Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard to the objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project. It should not exceed more than 1000 words.
- **Table of Contents**
  Titles and subtitles are to correspond exactly with those in the text.

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

- **Introduction**
  Here a brief introduction to the problem that is central to the project and an outline of the structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided.

- **Materials and Methods**
  This section should aim at experimental designs, materials used (wherever applicable). Methodology should be mentioned in details including modifications undertaken, if any. It includes organization site(s), sample, instruments used with its validation, procedures followed and precautions.
- **Results and Discussion**
  Present results, discuss and compare these with those from other workers, etc. In writing this section, emphasis should be laid on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in text books. Avoid abrupt changes in contents from section to section and maintain a lucid flow throughout the thesis. An opening and closing paragraph in every chapter could be included to aid in smooth flow.

  Note that in writing the various secions, all figures and tables should as far as possible be next to the associated text, in the same orientation as the main text, numbered, and given appropriate titles or captions. All major equations should also be numbered and unless it is really necessary, do not write in "point" form.

  While presenting the results, write at length about the the various statistical tools used in the data interpretation. The result interpretation should be simple but full of data and statistical analysis. This data interpretation should be in congruence with the written objectives and the inferences should be drawn on data and not on impression. Avoid writing straight forward conclusion rather, it should lead to generalization of data on the chosen sample.

  Results and its discussion should be supporting/contradicting with the previous research work in the given area. Usually one should not use more than two researches in either case of supporing or contradicting the present case of research.

- **Conclusion(s) & Recommendations**
  A conclusion should be the final section in which the outcome of the work is mentioned briefly.
  Check that your work answers the following questions:
  - Did the research project meet its aims (check back to introduction for stated aims)?
  - What are the main findings of the research?
  - Are there any recommendations?
  - Do you have any conclusion on the research process itself?

- **Implications for Future Research**
  This should bring out further prospects for the study either thrown open by the present work or with the purpose of making it more comprehensive.
- **Appendices**
  The Appendices contain material which is of interest to the reader but not an integral part of the thesis and any problem that have arisen that may be useful to document for future reference.
- **Suggested Readings:**
  Suggested Readings: should include papers, books etc. referred to in the body of the report. These should be written in the alphabetical order of the author's surname. The titles of journals preferably should not be abbreviated; if they are, abbreviations must comply with an internationally recognised system.

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Examples:

For research article:

Voravuthikunchai SP, Lortheeranuwat A, Ninrprom T, Popaya W, Pongpaichit S, Supawita T. (2002) Antibacterial activity of Thai medicinal plants against enterohaemorrhagic *Escherichia coli* O157: H7. *Clin Microbiol Infect* ,**8** (suppl 1): 116–117.

For book:

Kowalski,M.(1976) Transduction of effectiveness in *Rhizobium meliloti*. SYMBIOTIC NITROGEN FIXATION PLANTS (editor P.S. Nutman IBP), **7**: 63-67

The Layout Guidelines for the Project File & Project Report:

- A4 size Paper
- Font: Arial (10 points) or Times New Roman (12 points)
- Line spacing: 1.5
- Top and bottom margins: 1 inch/ 2.5 cm; left and right margins: 1.25 inches/ 3 cm

ASSESSMENT OF THE PROJECT FILE AND THE PROJECT REPORT

Essentially, the assessment will be based on the quality of the report, the technical merit of the project and the project execution. Technical merit attempts to assess the quality and depth of the intellectual efforts put into the project. Project execution is concerned with assessing how much work has been put in.

The Project should fulfill the following ***assessment objectives:***

- Range of Research Methods used to obtain information
- Execution of Research
- Data Analysis (Analyze Quantitative/ Qualitative information)
- Quality Control
- Conclusions

Assessment Scheme:

Continuous Evaluation:

40% (Based on punctuality, regularity of work, adherence to plan and methodology, refinements/mid-course corrections etc. as reflected in the Project File.)

Final Evaluation:

60% (Based on the Documentation in the file, Final report layout, analysis and results, achievement of objectives, presentation/ viva)

It is recommended that the Final evaluation should be carried out by a panel of evaluators.

GOOD LABORATORY PRACTICES SEMINAR

Course Code: CHY4408 **Credit Units: 01**

Objectives

The aim of the term paper is to provide the students with an opportunity to further enhance their knowledge ofgood laboratory practices. Undertaking this verysignificant practical unit of examining and analyzing various aspects of Chemistry. Good laboratory practice or GLP is a set of principles intended to assure the quality and integrity of non-clinical laboratory studies that are intended to support research or marketing permits for products regulated by government agencies. The term GLP is most commonly associated with the pharmaceutical industry and the required non-clinical animal testing that must be performed prior to approval of new drug products. However, GLP applies to many other non-pharmaceutical agents such as color additives, food additives, food contamination limits, food packaging, and medical devices.

GLP is a quality management system, not a scientific management system. Or, in other words, GLP defines a set of quality standards for study conduct, data collection, and results reporting. GLP does not define scientific standards. If a study follows GLP, then you can be reasonably sure that the reported results were collected as outlined in the study protocol; however, you cannot be sure that the study actually addresses the scientific hypothesis. In the world of cooking, GLP would ensure that someone follows the recipe exactly as written; however, it does not assure you that the recipe was good or that the resulting item will be tasty!

The student is expected to attend the Good Laboratory Practices Seminar's diligently. The student will be tested on the basis of understanding and organization of content based on the seminar.

Evaluation Scheme

Attendance	Active Participation/ Write up	Multiple Choice Questions/ Quiz	Solving the case/ Assignment	Total
10	30	35	25	100

CHEMISTRY OF NANOMATERIALS

Course Code: CHY4407 **Credit Units: 02**

Course objective: Material science plays a vital role in this modern age of science and technology. The rapid development in the field of nanomaterials and composite science has opened vast opportunities for better understanding and utilization of various materials. The course curriculum is designed to give students an idea of the detailed aspects of important topics of material science like composites, nanomaterials, their synthesis, characterization, and application.

Course Contents:

MODULE I: INTRODUCTION TO CHEMISTRY OF MATERIALS & NANOMATERIALS

Materials & their classification; Classifications of nanostructured materials; Fundamental differences between bulk materials and nanomaterials; Role of chemistry in material design, Nanoscale Science and Technology-Implications for Physics, Chemistry, Biology and Engineering; Length Scales involved and effect on properties: Mechanical, Electronic, Optical, Magnetic, and Thermal properties.

MODULE II: SYNTHESIS TECHNIQUES FOR NANOMATERIALS AND THEIR CHARACTERIZATION

Bottom-UP Approach: Self-Assembly, Sol-Gel Synthesis, Hydrothermal growth, Thin Film Growth – Physical Vapour Deposition, Chemical Vapour Deposition

Top-Down Approach: Emulsification-Diffusion Solvent Diffusion/Evaporation Method, Ball Milling, Microfabrication, Lithography

Characterization techniques: X-ray diffraction technique, Scanning Electron Microscopy, Transmission Electron Microscopy, Atomic Force Microscopy, particle size analyzer.

MODULE III: APPLICATION OF MATERIAL CHEMISTRY & NANOCHEMISTRY

Application of organic and inorganic nanoparticles; biomedical applications: design of nanoparticles for oral delivery of peptide drugs, development of nanoscaffolds for tissue engineering and regenerative medicine, bioimaging with quantum dots.

Industrial applications: Nanotechnology in packaging industries, textiles, solar cells, space exploration, computing and information technology; electrical conductive carbon nanotube (CNT) dispersed Si_3N_4 ceramics.

INTRODUCTION TO POLYMERIC MATERIALS

Course Code: CHY4405 **Credit Units:03**

Course Objective: The curriculum is developed to help the students to understand the importance of polymeric materials and their usefulness in day to day life. The Polymeric materials course aims to provide students with an understanding of the different kinds of polymers, their preparation, polymerization and chemical bonding between them. It also covers the applications of these polymeric materials in plastics, elastomers

Course Content:

MODULE I: INTRODUCTION TO POLYMER

History and Concept of macromolecules, monomers with specific example viz. acrylonitrile, vinyl, chloride, methyl methacrylate, isobutylene, isoprene, styrene, hexamethylene diamine and adipic acid, caprolactum, ethylene oxide and sebacic acid, ethylene glycol and terephthalic acid, functionality, Degree of polymerization, Classification of polymers depending on – (a) The origin (natural, Semisynthetic, synthetic etc. (b) The structure (linear, branched, network, hyperbranched, dendrimer (c) The formation (condensation, addition)(d) Homopolymers, copolymers(e) The behaviour on application of heat and pressure (thermoplastic and Thermosetting)(f) The form and application (plastics, fiber. elastomers and resin(g) Stereisomers: Isotactic, Syndiotactic, Atactic, Organic and Inorganic polymers. Concept of molecular mass, polydispersity, number average and weight average, molecular weight distribution in linear polymers.

MODULE II- CHEMISTRY OF POLYMERIZATION (MECHANISM)

chain polymerization- Free radical, Ionic and coordination mechanism, Common features of two types of Mechanism of cationic polymerization and anionic polymerization, Mechanism of coordination polymerization – Ziegler-Natta catalysts, Ring opening polymerization-mechanism of polymerization of cyclic ethers, cyclic amides and cyclosiloxanes.

MODULE III- METHODS OF POLYMERISATION

Methods of polymerization. Bulk polymerization, Solution polymerization, Emulsion polymerization, Suspension polymerization, Melt polycondensation. Controlled polymerization methods, viz, Nitroxide mediated polymerization (NMP), Atom Transfer Radical Polymerization (ATRP), Reversible Addition Fragmentation Termination (RAFT).

MODULE IV-SPECIAL POLYMERS AND THEIR APPLICATIONS

Polyethylene (LLDP, HDP, LLDPE and HDPE), PVC, polyvinyl accohol, polyvinylacetate, polybutadiene, polychloroperene, polystyrene, polyacrylare, PMMA, and acrylonitrrile copolymers.
polyamides (Nylon 6, Nylon 6,6, Nylon 6,10), polyesters (poly ethylene terephthalate (PET), polybutylene, terphthalate (PBT), aromatic polyesters), polycarbonate, polyurethanes – Flexible and rigid polyurethane, polyurethane elastomers, coatings, adhesives, sulphur, containing polymers, polimdes, polyethersulphones, polyetherketones. Thermosetting resins – phenolic resins, amino resins, epoxy resins, silicone polymers, and cyanate ester resins.

MODULE V- POLYMER DEGRADATION

Introduction, Types of degradation-Thermal, mechanical, Photodegradation, oxidative degradation, Hydrolytic degradation, Degradation by ultrasonic waves and high energy radiation.

COMPUTING AND C PROGRAMMING

Course Code: MTH4105 **Credit Units: 03**

Course Objectives:
The objectives of this course are to acquaint the students with the mathematics involved in basics of computers system, its components, data representation inside computer and to get them familiar with various important features of a procedure-oriented programming language i.e. C.

Course Contents:

Module-I: Data representation: number systems, character representation codes, binary, octal, hexadecimal and their inter conversions, binary arithmetic, floating point arithmetic, header files, static variables, register variables, declaration of variable names, data types and sizes, constants, format specifier, storage class, scope.

Module-II: Arithmetic operators, relational and logical operators, type conversions, increment and decrement operators, bit-wise operators, assignment operators and expressions, conditional expressions; precedence and order of evaluation. if else, nested if.

Module-III: Loops- switch, while and for, do-while. break and continue, go to and labels, Character Input Output Arrays, Character Arrays. Multi-Dimensional Arrays, Basics of Structures, Arrays of Structures, Unions.

Module-IV: Basics of functions, functions arguments block structures, recursion, pointers, function arguments, call by value, call by reference pointers and arrays functions, pointer arrays, pointers to pointers, command line arguments, strings operation.

C PROGRAMMING LAB

Course Code: MTH4106 **Credit Units: 01**

Software Required: Turbo C

Course Contents:

1. Some basic programs to understand the working of C language.
2. Programs involving conditional operator like if-end, elseif-end
3. Programs involving nested if-else-end
4. Programs involving multiple selections using switch statement
5. Programs involving loops like while and do while.
6. Programs involving for loops.
7. Programs involving user defined function calls.
8. Programs involving arrays and matrices
9. Programs involving strings
10. Programs involving structures
11. Programs involving Unions
12. Programs involving pointers, and solving various problems with the help of those.
13. Programs involving file handling

OPERATIONS RESEARCH

Course Code: MTH4217 **Credit Units: 04**

Course Objectives:
The problems in optimization are the most common applications of mathematics. The main aim of this course is to present different methods of solving optimization problems in the areas of linear programming, nonlinear programming, and integer linear programming. In addition to theoretical treatments, there will be some introduction to numerical methods for optimization problems.

Course Contents:
Module-I: **Review** Introduction to Operation Research**,** Linear programming problem and its formulation, convex sets and their properties, graphical method, basic feasible solution, simplex method, big-M and two phase methods; infeasible and unbounded LPPs, alternate optima; Dual problem and duality theorems, dual simplex method and its application in post optimality analysis; Sensitivity Analysis, Balanced and unbalanced transportation problems, Vogel's approximation method for solving transportation problems; Hungarian method for solving assignment problems.

Module-II: Dynamic Programming Bellman's Principle of optimality of Dynamic Programming, Multi- stage decision problem and its solution by Dynamic Programming with finite number of stages, Solution of linear programming problems as a Dynamic Programming problem.

Module-III: Integer Linear Programming Problems: Integer Linear Programming Problems, Mixed Integer Linear Programming Problems, Cutting Plane Method, Branch and Bound method.

Module-IV: PERT and CPM: Basic idea of PERT & CPM, Difference between PERT & CPM, PERT/CPM network components and precedence, Relationship critical path analysis, Project Scheduling, Project Time Cost, Trade Off, Resource allocation.

TOPOLOGY

Course Code: MTH4205 **Credit Units: 04**

Course Objectives:
Topology is a modern branch of geometry. It serves to lay the strong foundations of concepts for study in analysis and in geometry. It is also a prerequisite for many concepts related to Analysis. The course is designed to develop an understanding of topological ideas & techniques and their role in analysis.

Course Contents:
Module-I: Introduction: Finite, countable, uncountable sets, functions, relations, axiom of choice, Zorn's Lemma. Schroder Bernstein theorem.

Module-II: Topological Spaces and Continuous Functions: Open sets, closed sets, basis for a topology, sub basis, T1 and T2 spaces, order topology, product topology, subspace topology, limit point, continuous function, general product topology, metric space and its topology, quotienttopology.

Module-III: Connectedness and Compactness: Connected spaces, connected subspaces, local connectedness, compact subspace, limit point compactness, local compactness.

Module-IV: Countability and Separation Axioms: Countability axioms, separation axioms, regular and normal spaces, Urysohn's Lemma, Urysohn Metrization Theorem, Tietze Extension Theorem, Tychonoff Theorem.

STATISTICS BASED LAB-I

Course Code: MTH4206 **Credit Units:01**

MTH4206		L	T	P	C
Version		0	0	2	1
Pre-requisites/Exposure	Basics knowledge of Statistics				
Co-requisites					

Course Objectives:

The objective of this Lab work is to acquaint students to use statistical software in computation and interpretation of various statistical results.

1. To plot the histogram, pi-chart, scatter plot and bar-chart etc.
2. To find the measure of arithmetic mean, geometric mean, and harmonic mean of the given data.
3. To find the measure of median and mode of the given data.
4. To find the measure of Range, Quartile deviation, Mean deviation.
5. To find the measure of standard deviation and variance of the given data.
6. To measurement of moments.
7. To measurement Skewness & Kurtosis.
8. To check the linear relationship between two variables using correlation coefficient.
9. To check the non-linear relationship between two variables using correlation coefficient.
10. To find the lines of best fit used for predictions by using the regression analysis.

INTRODUCTION TO MATLAB

Course Code: MTH4215 **Credit Units: 03**

Course Objectives:
The objectives of the course are to familiarize the students with the main features of the MATLAB integrated design environment. Students will learn concepts related to programming in MATLAB and they will also get to the exposure to use few built-in functions to solve many practical problems.

Course Contents:

Module-I: Introduction to MATLAB and Plotting: vector and matrix generation, subscripting and the colon notation, matrix and array operations and their manipulations, introduction to some inbuilt functions. Two & three-dimensional graphics: basic plots, change in axes and annotation in a figure, multiple plots in a figure, saving and printing figures, mesh plots, surface plots and their variants.

Module-II: **m-Files**: scripts and user defined functions, calling functions into a script file, sub-functions, and nested functions, concept of local and global variable, few examples of in-built functions, editing, saving m-files.

Module-III: Loops and Conditional statements: Flow control using various statements and loops including For-End and While-End loops with Break commands. Conditional Statements: If-End statement, If-Else-End statement, nested If-Else-End statements.

Module-IV: Applications of MATLAB: Solving a linear system of equations including over determined and system with infinitely many solutions. Calculus of polynomials using inbuilt functions, Solving equations in one variable, Solving IVPs using inbuilt functions.

MATLAB PROGRAMMING LAB

Course Code: MTH4216 **Credit Units: 01**

Course Objectives:
MATLAB is a scientific computing tool which covers almost all area of science and engineering. Students will be using MATLAB environment to solve various types of mathematical problems.

Course Contents:
Fundamentals of Linear Algebra, Numerical Analysis, Differential Equations and their application using MATLAB :

1. Generating arrays and matrices and their manipulations
2. Eigenvalues & Eigenvectors of various type of matrices
3. Using built-in functions to solve system of equations
4. Functions related to plotting 2D and 3Dplots
5. Introducing built-in functions for numerical approximations
6. Annotation of Plots
7. Writing m files including script and function files
8. Introducing notion of sub-functions and nested functions
9. Solving IVPs using ode45 and other solvers
10. Solving system of equations of IVPs

NUMERICAL ANALYSIS

Course Code: MTH4325 **Credit Units: 03**

Course Objectives:
The objectives of this course are to introduce some advanced numerical methods, commonly used in research to the post graduate students. Student will be introduced to numerical techniques for solving algebraic and transcendental equation, Interpolation of polynomial, Differentiation, Integration and ordinary differential equations.

Course Contents:
Module-I: Solution of Algebraic and Transcendental Equations: Bisection method, Regula-Falsi method, Iteration method, Newton Raphson method, Newton Raphson method for multiple roots, Secant method as an improvement on Newton Raphson method, and Muller's method, Graeffe's Root Square Method. Convergence and error analysis of these methods.

Module-II: Finite differences, interpolation and approximation: Finite difference operators, their properties and their interrelations, problems based on finite difference tables, Newton's forward and Newton's backward interpolation formula, various central difference formulae including Stirling's formula, Bessel's formula and Cubic -Spline interpolation. Divided differences: Operators and difference table, Newton's divided difference formula, Lagrange's interpolation formula.

Module-III: Solution of system of linear equations:
Direct methods: Cramer's rule, Matrix inverse method, Gauss elimination and Gauss-Jordan method, LU decomposition method. Iterative methods: Jacobi's method, Gauss-Seidel method and their convergence criterion. Concept of ill-conditioning, and condition number for system of equations.

Module-IV: Numerical Differentiation and Integration: Numerical differentiation using Newton's for- ward and backward formula, order of leading error terms. Newton-Cotes quadrature formula - derivations & comparison of Trapezoidal rule, Simpsons 1/3 and 3/8 rules. Error analysis of these methods. Numerical solution of first order differential equations: Euler's method, modified Euler's method, Predictor-Corrector Method, Runge-Kutta second order and fourth order methods, their derivations and their extension to solve system of IVPs.

NUMERICAL ANALYSIS LAB

Course Code: MTH4327 **Credit Units: 01**

Softwares required: Turbo C and MATLAB

Course Objective:

The objective of the course is to explain the most common numerical methods used in engineering analysis, when to use each method, and how to implement basic methods in a structured manner using MATLAB's programming language.

Course Contents:

Module-I: Roots of Transcendental Equations: Programs for Initial approximation for roots, Bisection method, Regula-Falsi method, Iterative method, Newton Raphson method, Secant method. Comparison of these methods. How to use built-in functions to find the roots of Transcendental Equations.

Module-II: System of Linear Equations: Programs for Jacobi method, Gauss-Seidal method, their comparative study using various stopping criterion. Programs for forward and back substitution, LU decomposition method, and using built in functions for system of equations.

Module-III: Programs for Numerical Differentiation, Programs for trapezoidal rule, Simpson's 1/3 and 3/8 rule and their comparison. Using built-in functions for both numerical differentiation and numerical integration.

Module-IV: Programs for solving IVPs for Euler's method and its variants. How to use built in functions for solving IVPs and how to extend the code for solving system of IVPs.

Summer Workshop

Course Code: MTH4335 **Credit Units: 03**

Workshop will be conducted for one-week (six hours per day). The content of the course will be intended to give an exposure to

- Technical softwares /tools related to scientific computing and statistics.
- Report writing, Presentation etc.

The students will have to appear for class-test(s) during the workshop.

- During summer break, students have to work on the assignment(s) given to them.
- The assignment(s) will have to be submitted within two weeks of commencement of new semester followed by viva-voce.
- The evaluation will be done by the committee comprising of faculty members who served as resource persons in the workshop.

Evaluation scheme:

NUMBER THEORY & CRYPTOGRAPHY

Course Code: MTH4329 **Credit Units: 04**

Course Objectives:
The course provides an introduction to basic number theory, where the focus is on computational aspects with applications in cryptography. Moreover, the course provides an introduction to some basic cryptographic techniques to understand fundamental mathematical concepts underlying digital signatures, public key encryption, and key establishment protocols.

Course Contents:
Module-I: Euclid's division lemma, Divisibility, The Linear Diophantine Equation, the fundamental theorem of Arithmetic, Fermat's Little theorem, Wilson's Theorem, Generating functions. Congruences, Residue Systems, The Theorems of Fermat and Wilson Revisited, The Chinese Remainder Theorem.

Module-II: Combinatorial Study of $\phi(n)$, Formulae for $d(n)$ and $\sigma(n)$, Multiplicative Arithmetic Functions, The Mobius Inversion Formula, Primitive Roots Modulo p, Tchebychev's Theorem. Euler's Criterion, the Legendre Symbol, The Quadratic Reciprocity Law, Consecutive Residues and Non-residues.

Module-III: Cryptographic Hash Functions Hash functions and data integrity, security of Hash functions, The random oracle model, algorithms in random oracle model, comparison of security criteria, Compression functions from encryption functions, Hash functions from compression functions.

Module-IV: Public Key Cryptography and Discrete Logarithms Finite fields, construction, The Elgamal crypto system, RSA public key crypto system, algorithms for discrete logarithm problems, Shanks Baby step Giant step algorithms, The pollard algorithm, factoring algorithms, attacks on RSA, security of Elgamal system, The Deffe Hellman key exchange problems, Digital signature algorithms using RSA, secrete key sharing principles, The Shamir Secret sharing protocol.

FLUID DYNAMICS

Course Code: MTH4409 **Credit Units: 04**

Course Objectives:
Almost everything on this planet is either in a state of fluid or moves within or near a fluid. Fluids have the ability to transport matter and its properties as well as transmit force. The main objectives of the course are to develop fundamental knowledge and understanding of the mechanics of fluid both at rest and in motion.

Course Contents:

Module 1: Introduction
Definition: Fluid, Fluid Dynamics, Stress (shear stress and normal stress), strain, viscosity (dynamic and kinematic). Variation of viscosity with temperature for liquids and gases. Continuum hypothesis, No-slip boundary condition, application areas of fluid dynamics.
Kinematics: Different types of forces: Viscous and inertial forces
Some common non-dimensional parameters and their physical significance: Reynolds number, Froude number and Mach number. (12 lectures)

Module 2: Newton's law of viscosity, Classification of fluids: Newtonian and Non-Newtonian fluid, compressible and incompressible fluid. Inviscid, ideal and real fluid. Different types of flow: Uniform and non-uniform, steady and unsteady, rotational and irrotational flow, Laminar, Turbulent and Transient flow. Flow description: Eulerian and Lagrangian description of fluid motion. Fluid element trajectories: Streamline, pathline, streakline, timeline. (12 lectures)

Module 3: Introduction to Tensors: Definition, rank of tensor, Einstein notation or indical notation, free and dummy indices. Vector operations and calculus operations using index notation (Einstein notation).
Cauchy stress tensor, deviatoric stress tensor, volumetric stress tensor.
Deformation of fluid-elements: derivation of rate of translation vector, rate of rotation, vorticity vector, linear strain rate, strain rate tensor, deformation tensor. (12 lectures)

Module 4: Bernoulli's equation - assumptions and applications.
Differential Analysis: Differential equations of mass and momentum for incompressible flows: inviscid - Euler equation and viscous flows - Navier-Stokes equations, concept of fluid rotation, vorticity, stream function, Exact solutions of Navier-Stokes equation for Couette Flow and Poiseuille flow. (12 lectures)

PROJECT

Course Code: MTH4437 **Credit Units: 06**

GUIDELINES FOR PROJECT REPORT: The Project Report is the final research report that the student prepares on the project assigned to him/her. The following components should be included in the project report:

1) Title or Cover Page: The title page should contain Project Title; Student's Name; Programme; Year and Semester and Name of the Faculty Guide.

2) Acknowledgement(s): Acknowledgment to any advisory or financial assistance received in the course of work may be given. It is incomplete without student's signature**.**

3) Abstract: A good "Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard to the objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project.

4) Table of Contents: Titles and subtitles are to correspond exactly with those in the text.

5) Introduction: Here a brief introduction to the problem that is central to the project and an outline of the structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided**.**

6) **Results and Discussion:** Present results, discuss and compare these with those from other workers, etc. In writing this section, emphasis should be laid on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in text books.

7) Conclusion(s) & Recommendations: A conclusion should be the final section in which the outcome of the work is mentioned briefly. Check that your work answers the following questions: Did the research project meet its aims (check back to introduction for stated aims)? What are the main findings of the research? Are there any recommendations?

8) **References:** References should include papers, books etc. referred to in the body of the report. These should be written in the alphabetical order of the author's surname. The titles of journals preferably should not be abbreviated; if they are, abbreviations must comply with an internationally recognised system

The Layout Guidelines for Project Report:

1)A4 size Paper

2) Font: Arial (10 points) or Times New Roman (12 points)

3) Line spacing: 1.5

4)Top and bottom margins: 1 inch/ 2.5 cm; left and right margins: 1.25 inches/ 3cm

Assessment Scheme: Continuous Evaluation: 40% (Based on punctuality, regularity of work, adherence to plan and methodology, refinements/ mid-course corrections etc. as reflected in the Project File.)

Final Evaluation: 60% (Based on the Documentation in the file, Final report layout, analysis and results, achievement of objectives, presentation/ viva)

It is recommended that the Final evaluation should be carried out by a panel of evaluators.

CLASSICAL MECHANICS

Course Code: MTH4410 **Credit Units: 04**

Course Objectives:
A detailed exposition of classical mechanics for the student, opting for physics is so vitally important for a clear understanding of recent intricate theories of quantum mechanics, modern physics and research for they are built an well developed and conceptualized foundation.

Course Contents:
Module-I: Lagrangian Formulation Mechanics of a system of particles, constraints, D'Alembert's principle, Variational calculus and its applications, Lagrangian equations, conservation theorems and symmetry properties, applications of Lagrangian formulation.

Module-II: Central Force Problem Reduction to one body problem, equation of motion and first integral, one dimensional problem and classification of orbits, Differential equation for the orbit, Kepler problem and planetary motion, Rutherford formula, scattering in central force field, transformation to laboratory frames.

Module-III: Rigid Body and Vibrating System Euler angles, tensor of inertia, kinetic energy of a rotat- ing body, symmetric top and applications. Vibrating string, solution wave equation, normal vibrations, dispersion, coupled vibrating system. Non linear Dynamics, phase trajectories.

Module-IV: Hamiltonian Formulation Hamiltonian equation of motion, Hamilton's equation in different co-ordinate systems example in Hamiltonian dynamics, two dimensional harmonic oscillator the equations of canonical transformations, cyclic coordinates, phase space and Liouville's theorem, Poisson bracket. Lagrange brackets, general Poisson bracket under canonical transformation.

BIOMECHANICS

Course Code: MTH4412 **Credit Units: 04**

Course Objectives:
The objectives of this course are to study the mechanics of flow of blood in human beings and movement of insects, spread of viruses etc by using mathematical tools like ordinary differential equation, partial differential equation, Calculus of variation, Laplace Transforms etc.

Course Contents:
Module-I: Mathematical Aspects of population biology; Some fundamental aspects, Models and their mathematical formulations, Single species models, Stability and classification of equilibrium points, Relationship between eigen values and critical points.

Module-II: Introduction to Biological Fluid Mechanics: Basic concepts of Fluid Dynamics, Fluid Parameters, Viscosity, Navier- Stokes Equations of viscous fluid motion, Poiseuille's flow, Model for blood flow, Properties of blood, Pulsatile Flow of blood sedimentation.

Module-III: Modeling through partial differential equations: simple models, mass balance equations, Variational principles, probability generating function, traffic flow problems, initial & boundary conditions.

Module-IV: Study of alcohol in the blood stream; Volume of blood in human body; Stochastic epidemic model; Genetic graphs; Food webs: Linear programming in forest management; Mathematics in fisheries; Case studies on anchovy wipe out.

STOCHASTIC PROCESSES

Course Code: MTH4414 **Credit Units: 04**

Course Objectives:
To introduce the basic concepts of stochastic processes.

Course Contents:
Module-I: Poisson Process: Inter-arrival and waiting time distributions, conditional distributions of the arrival times, non-homogeneous Poisson process, compound Poisson random variables and Poisson processes, conditional Poisson processes.

Module-II: Markov Chains: Introduction and examples, Chapman-Kolmogorov equations and classification of states, limit theorems, transitions among classes, the Gamblers ruin problem, mean time in transient states, branching processes, applications of Markov chain, time reversible Markov chains, semi Markov processes.

Module-III: Continuous-Time Markov Chains: Introduction, continuous time Markov chains, birth and death processes, The Kolmogorov differential equations, limiting probabilities, time reversibility, applications of reversed chain to queueing theory.

Module-IV: Brownian Motion and other Markov Processes: Introduction, hitting time, maximum variable, Arc sine laws, variations on Brownian motion, Brownian motion with drift, backward and forward diffusion equations.

STATISTICAL INFERENCE

Course Code: MTH4415 **Credit Units: 04**

Course Objectives:
To introduce the concepts of statistical inference.

Course Contents:
Module-I: Point estimation. Characteristics of a good estimator: Unbiasedness, consistency, sufficiency and efficiency. Method of maximum likelihood and properties of maximum likelihood estimators (without proof). Method of minimum Chi-square. Method of Least squares and method of moments for estimation of parameters. Problems and examples.

Module-II: Sufficient Statistics, Cramer-Rao inequality and its use in finding MVU estimators. Statistical Hypothesis (simple and composite). Testing of hypothesis. Type I and Type II errors, significance level,
p-values, power of a test. Definitions of Most Powerful (MP), Uniformly Most Powerful (UMP)and Uniformly Most Powerful Unbiased (UMPU)tests.

Module-III: Neyman-Pearsons lemma and its applications for finding most powerful tests for simple hypothesis against simple alternative. Tests based on t, F and X^2distributions.

Module-IV: Likelihood ratio tests and their reduction to standard tests. Large sample tests. Interval estimation, Pivotal quantity and its use in finding confidence intervals, concept of best confidence intervals.

NUMERICAL SOLUTIONS TO ODE AND PDES

Course Code: MTH4416 **Credit Units: 04**

Course Objectives:
The course covers few classical and contemporary methods for solving initial and boundary value problems. Finite difference operators and their application to solve various types of PDEs shall be introduced in the course.

Course Contents:
Module-I: Iterative solvers for nonlinear equations and system of linear equations: Iterative method and Newton's method for system of nonlinear equations; Iterative methods to solve system of linear equations including Gauss-Seidel and Jacobi's method with pivoting; Concept of norms and condition number; Application of these methods for test problems using MATLAB codes.

Module-II: Initial value Problems Single-step methods: General definitions and Lipschitz condition, Derivations and stability analysis for Taylor series method, Euler's method and its variants, Runge-Kutta second order and fourth order methods; Implementation of these methods for various test problems using MATLAB.

Module-III: Initial value Problems Multi-step methods: General definitions and derivations of Adams Bashforth, Adams Moulton methods, Predictor-corrector method; stability analysis of these methods and application of these methods for some test problems using MATLAB.

Module-IV: Introduction to Finite difference methods General concepts of truncation error and stability for a finite difference scheme; Numerical solution of one-dimensional heat equation, including Explicit Euler, Backward Euler, Crank-Nicolson schemes with various type of boundary and initial conditions; Laplace Equations and Poisson's equations with different type of boundary and initial conditions.

CLASSICAL MECHANICS

Course Code: PHY4102 **Credit Units: 04**

Course Objective:
A detailed exposition of classical mechanics for the students, opting for physics is vitally important for a clear understanding of recent intricate theories of quantum mechanics, Modern Physics and research to build a well developed and conceptualized foundation.

Course Contents:

Module I: Symmetries and Conservation Laws
Mechanics of a system of particles, constraints, D'Alembert's principle, Variational calculus and its applications, Hamiltons variational Principle, Lagrangian equations, applications of Lagrangian formulation, conservation theorems and symmetry properties.

Module II: Hamiltonian Formulation
Hamiltonian equation of motion, applications of hamiltonian formulation, Principle of least action, the equations of canonical transformations, cyclic coordinates, phase space and Liouville's theorem, Poisson bracket, Jacobi's Indentity .

Module III: Central Force Problem
Reduction to one body problem, equation of motion and first integral, one dimensional problem and classification of orbits, Differential equation for the orbit, Kepler problem and planetary motion, Rutherford formula, scattering in central force field, transformation to laboratory frames.

Module IV: Rigid Body and Vibrating System
Euler angles, tensor of inertia, kinetic energy of a rotating body, symmetric top and applications.
Vibrating string, solution wave equation, normal vibrations, dispersion, coupled vibrating system.

ELECTRONICS

Course Code: PHY4103 **Credit Units: 04**

Course Objectives

The objective of this course is to

- To provide an overview of basic combinational circuits-logic gates, flip-flops, registers, operational amplifier, modulation techniques and integrated circuit fabrication.
- To serve as the foundation for practical lab experiments.

Course Outcomes

On completion of this course, the students will be able to

CO1 Clearly understand the basics of digital electronics.
CO2 Understand the Integrated Circuit Fabrication and Technology.
CO3 Clearly define the characteristics of an operational amplifier.
CO4 Clearly understand the concept of modulation and demodulation

Catalog Description

This course gives a comprehensive view of the digital electronics, integrated circuit fabrication and technology, operational amplifiers, modulation and demodulation techniques. It covers the basic operation and some common applications.

Course Content

Module I: Combinational Circuits **12 Lectures**

Truth tables Logic gates: OR, AND, Inverter gates, The Universal NOR and NAND gates, XOR and XNOR gates, De-Morgan's Theorem, Reduction Technique Karnaugh map simplification. Parity check. The half adder, the Full adder, half and full subtractor.
Sequential Logic: Latches, R.S. Flip/Flop, The D.Flip/Flop, T.Flip/Flop, J.K. Flip/flop, Master/ slave flip/flop, Race Problem. Universal Shift Register, shift counter, Ring Counter.

Module II: Operational Amplifiers **16 Lectures**

The ideal Op-Amp-inverting, non-inverting and differential amplifiers-CMRR; Op-Amp IC building blocks-emitter coupled differential amplifier, active load, level shifting and output stage; Op-Amp characteristics-open-loop input output characteristics, frequency response and slew rate; Op-Amp applications-adder, subtractor, integrator, differentiator, comparator, voltage-to-current converter, current-to-voltage converter and logarithmic amplifier.

Module III: Modulation Techniques **12 Lectures**

Definition, Amplitude modulation, Methods of Amplitude Modulation, Frequency Modulation, Phase Modulation, Pulse Modulation Systems- PAM, PWM, PPM, PCM, Delta Modulation, Principle of AM Detection. Digital modulation schemes: amplitude, phase and frequency shift keying schemes (ASK, PSK, FSK). Multiplexing - time division and frequency division. Applications of Modulation.

Module IV: Integrated Circuit Fabrication **8 Lectures**

Integrated-Circuit Technology, Advantages and limitations of Integrated Circuits, Basic Monolithic Integrated Circuits, Epitaxial Growth, Masking and Etching, Diffusion of Impurities, Integrated Capacitors and Inductors, Large-Scale and Medium-Scale Integration, Metal-Semiconductor Contact

QUANTUM MECHANICS-I

Course Code: PHY4109 **Credit Units: 04**

Course Objective:

Course Contents:

Module I: Introductory concepts
A quick review of failure of classical Physics, Wave particle duality, Wave-packet, Uncertainty principle and its applications
Schrodinger's time dependent equation; Statistical interpretation of wave function, normalization, probability current density, expectation values, Ehrenfest's theorem, Time independent Schrodinger equation, stationary states, orthogonality, Energy, linear momentum and angular momentum operators.

Module II: General Formalism
Linear vector space, linear operators, eigenfunction and eigenvalues, Herimtian operator, Postulates of Quantum Mechanics, Simultaneous measurability of observables, General Uncertainty relation, Dirac's notation (bra & ket), Schrodinger and Heisenberg representation.

Module III: Applications
Quick review of particle in 1D and its extension to 3D box, degeneracy of energy states. Square potential barrier, quantum tunneling and alpha emission. Harmonic Oscillator using operator method, creation and annihilation operators.

Module IV: Hydrogen atom and angular momentum
Schrodinger equation in three dimension (spherical coordinates), separation of variables, radial equation, angular equation, spherical harmonics, angular momentum and their commutation relation, L^2 and L_z operators, Ladder operator.

COMPUTATIONAL PHYSICS

Course Code: PHY4110 **Credit Units: 04**

Course Objective:
This course aims at exposing the students to basic Computational Physics which will be useful for them to solve the problems of Physics.

Course Contents:

Module I Introduction to MATLAB and Plotting: vector and matrix generation, subscripting and the colon notation, matrix and array operations and their manipulations, introduction to some inbuilt functions. Two & three-dimensional graphics: basic plots, change in axes and annotation in a gure, multiple plots in a gure, saving and printing gures, mesh plots, surface plots and their variants.

Module II m-files: scripts and user de ned functions, calling functions into a script le, subfunctions, and nested functions, concept of local and global variable, few examples of in-built functions, editing, saving m- les.

Module III Loops and Conditional statements: Flow control using various statements and loops in-cluding For-End and While-End loops with Break commands. Conditional Statements: If-End statement, If-Else-End statement, nested If-Else-End statements.

Module IV Applications of MATLAB: Introduction to builtin functions: related to matrix inversion, eigenvalues, eigenvectors, condition number; for data representation: bar charts, histograms, pie chart, stem plots etc; for solving various type of di erential equations; for specialized plotting e.g., contour plots, sphere, and animations.

INTEGRATED PHYSICS LAB-I

Course Code: PHY4111 **Credit Units: 03**

List of Experiment (Any Eight)

1. Data and error analysis.
2. Plotting and curve fitting software
3. Use of the instruments CRO, multimeter.
4. To design and study various aspects of frequency modulation and demodulation. PAM, PWM and PPM Modulation and demodulation.
5. To study the frequency response of an operational amplifier & to use operational amplifierfor different mathematical operations.
6. To design and study the characteristics of a regulated power supply and voltage multiplier circuits.
7. To design a rectangular/triangular waveform generator using Comparators and IC8038.
8. To design (i) Low pass filter (ii) High pass filter; (iii) All-pass filter; (iv) Band pass filter (v)Band-reject passive filter.
9. To design and study logic gates and flip flop circuits.
10. Use of timer IC 555 in astable and monostable modes and applications involving relays, LDR.
11. The Torsional Pendulum and Moment of Inertia
12. Study of the Coriolis effect.
13. Determination of Lande's factor using ESR spectrometer.
14. To plot the polar curve of a filament lamp and to determine its mean spherical intensity.
15. Raman effect in liquids.
16. Rydberg's constant using constant deviation prism.

STATISTICAL MECHANICS

Course Code: PHY4202 **Credit Units: 04**

Course Objective: The aim of the course is to introduce the concept of statistical mechanics and applications to various problems in applied Physics.

Course Contents:

Module-I:

Kinetic theory of gas, Probability concepts in statistical mechanics, Random walk problem, General Aspects of Probability Distributions

The Statistical Basis of Thermodynamics, The macroscopic and the microscopic states, Contact between statistics and thermodynamics, Entropy on microscopic scale, physical significance of the number Ω(N,V,E), Thermodynamic equilibrium, Mechanical equilibrium, Chemical equilibrium, Review of phase space, Liouville's theorem, basic postulates of statistical mechanics, The classical ideal gas, The entropy of mixing and Gibb's paradox, Sackur tetrode equation of entropy, Correct Boltzmann counting

Module II Elements of ensemble theory, microcanonical, canonical, grand canonical ensemble, quantum states and the phase space, equilibrium between system and a heat reservoir, partition function, physical significance of the various statistical quantities in the canonical ensemble, The classical systems, energy fluctuations in the canonical ensemble, statistics of paramagnetism, Boltzmann's equation, Maxwell & Boltzmann statistics, Equipartition theorem and its Simple applications, Virial theorem,. Maxwell velocity distribution, related distributions and mean values.

Module III Equilibrium between a system and a particle- energy reservoir, density and energy fluctuations in Grand canonical ensemble, formulation of quantum statistics, Fermi-Dirac and Bose-Einstein statistics. Applications of the formalism to: (a) Ideal Bose gas, The field of sound waves, Einstein and Debye theory of specific heat, properties of black-body radiation, Bose- Einstein condensation, experiments on atomic BEC,(b) Ideal Fermi gas, properties of simple metals, Pauli paramagnetism, electronic specific heat, Compressibility of Fermi gas, A relativistic degenerate electron gas.

Module IV Phase transition, non-equilibrium statistical mechanics, Ising model, fluctuation-dissipation

QUANTUM MECHANICS-II

Course Code: PHY4208 **Credit Units: 04**

Course Objective:
The course is intended to introduce the concept of quantum mechanics to students at the advanced level so that they can solve problem of various branches of Physical Sciences.

Course Contents:

Module I: Spin & Identical Particles
Spin, Stern-Gerlach experiment, Pauli spin matrices, eigenvalues of J^2 and J_z, addition of angular momenta, Clebsh-Gordan coefficients.
Identical particles, particle exchange operator, symmetric and anti-symmetric wave functions, Pauli principle and Slater determinant, spin functions for system with more than one electron.

Module II: Perturbation theory
Time-independent perturbation theory: Basic concepts, Non-degenerate energy levels, degenerate perturbation theory, fine structure of Hydrogen, Spin-orbit coupling, Zeeman effect.
Time-dependent perturbation theory: 1st order perturbation, Fermi's Golden rule, absorption and emission of radiation, Einstein A and B coefficient.

Module III: Variational principle and WKB approximation
Theory of Variational principle; Ground state energy for 1D harmonic oscillator, Delta function potential, and He.
WKB approximation, classical region, tunneling, Gamow's theory of alpha decay, connection formula.

Module IV: Scattering theory and relativistic wave equation:
Scattering cross section, scattering amplitude, Centre of Mass frame, Laboratory frame, partial wave, scattering by a central potential (partial wave analysis), phase shift, Born approximation, Validity of Born Approx.
Klien-Gordon equation and its interpretation, Dirac equation for a free particle.

ELECTRODYNAMICS

Course Code: PHY4215 **Credit Units: 04**

Course objective:
The course is suitable as core course for Master of Science Applied Physics students. The course is designed to familiarize and train the student with the tools and techniques used to assess the various problems of electrodynamics. The course provides the in-depth knowledge of electrostatics, magnetostatics, the cases of non-static current and charge densities and related changes. The course also aims at developing an ability to analyse the situation and to apply appropriate techniques to reach to solutions of a particular problem of electrodynamics.

Course Contents:
Module I-Electromagnetic (EM) Fields and Potentials
Dirac-delta function. Green's Theorem, Electrostatics: Laplace and Poisson equations; Dirichlet and Neumann boundary conditions; Method of images (point charge near a conducting plane and a sphere); Separation of variables in Cartesian and spherical coordinates. Magnetostatics: Curl and divergence of magnetic field; vector potential; Divergence of vector potential, Magnetic Scaler potential. Correction in the Ampere's law and Maxwell's equation.

Module II: Electromagnetic Waves and Propagation
EM waves in vacuum: Wave equation of E & B; Energy density of Fields and Poynting's theorem; conservation of momentum and Maxwell's stress tensor. Boundary conditions on field vectors D, E, B and H; Gauge transformations: Lorentz and Coulomb gauges. energy & momentum of EM waves; Propagation of EM waves in matter: propagation in linear media, reflection and transmission, Fresnel equation; Polarisation of Electromagnetic waves, Brewster's angle, EM waves in conducting media, skin depth, reflection and transmission in conducting media.

Module III: Guided Waves and Radiation Guided Waves: Electromagnetic waves in ionosphere, Wave guides; TE, TM and TEM modes; Rectangular wave guide; Dispersion of EM waves and Cauchy's formula, resonant cavity Radiation: Retarded Potentials, Lienard-Wiechert potentials; fields of a moving point charge; electric dipole radiation magnetic dipole radiation.

Module IV: Relativistic Electrodynamics Four vector formalism: Four vectors; Covariant and contravariant vectors; Transformation of Four vectors; Velocity, Current, Momentum and Potentials as four vectors. Lorentz transformation in four vector notation Covariance of Electrodynamics.

ATOMIC AND MOLECULAR PHYSICS

Course Code: PHY4216 **Credit Units: 04**

Course Objective: The aim of this course is to give the basic ideas about the structure of atoms and molecules, electronic structure, interaction of radiation and external fields with atoms and molecules.

Course Contents:

Module I

Quantum states of one electron atoms, Hydrogen spectrum, Larmor's theorem, Magnetic moment and Bohr magnetron, Spin orbit interaction, hydrogen fine structure, Vector atom model, two electron systems, LS and jj Coupling schemes, spectroscopic terms, equivalent and non equivalent atoms, Helium atom spectrum, spectra of alkali atoms, Nuclear spin, magnetic moment, isotopic effect and Hyperfine structure, Normal and anomalous Zeeman effect, Paschen Back effect, Stark effect.

Module II

Rotational spectra of diatomic molecules as a rigid rotor and non rigid rotor, intensity of rotational lines, Diatomic molecule as a simple harmonic oscillator, vibrational energy of diatomic molecule, Anharmonicity, Vibrational-rotational spectra, Raman effect, quantum theory of Raman effect, rotational Raman spectra, vibrational Raman spectra .

Module III

Electronic band spectra, electronic energy and total energy, vibrational structure of electronic transitions, rotational structure of electronic bands, The branches(P,Q,R) of band, Band head formation. Intensities in electronic bands, Frank-Condon principle, Fortrat diagram.

Module IV

Interaction of atoms in the formation of molecules, covalent, ionic bonding and vander Waal's interactions, concept of molecular potential, Born-oppenheimer approximation, Electronic states of diatomic molecules, Electronic angular momenta, The LCAO approach, states for hydrogen molecular ion, Coulomb, exchange, overlap integral, symmetries of electronic wave functions. Term symbols for simple molecules.

INTEGRATED PHYSICS LAB-II

Course Code: PHY4212 **Credit Units: 03**

List of Experiment (Any Eight)

1. Measurement of vacuum using the Pirani/thermocouple gauge.
2. Measurement of lattice parameters and indexing of powder patterns.
3. Determination grain size of the alloy by optical microscope.
4. Calculation of the optical band gap of the semiconductor by absorption spectroscopy.
5. Calculation of the grain size and strain in the samples from the XRD pattern data.
6. Production and measurement of high pressure.
7. To study temperature-dependence of conductivity of a given semiconductor crystal using four probe method.
8. To determine the Hall coefficient for a given semi-conductor.
9. To determine dipole moment of an organic molecule.
10. To study the lattice dynamics using LC analog kit.
11. To study the characteristic of J-H curve using ferromagnetic standards.
12. To determine the velocity of ultrasonic waves using interferometer as a function of temperature.
13. Temperature dependence of a ceramic capacitor - Verification of Curie-Weiss law for the electrical susceptibility of a ferroelectric material.
14. Tracking of the Ferromagnetic-paramagnetic transition in Nickel through electrical resistivity.
15. To study the characteristics of a PN junction with varying temperature & the capacitance of the junction.
16. (i) Study of the characteristics of klystron tube and to determine its electronic tuning range;(ii) To determine the standing wave ratio and reflection coefficient; (iii) To determine the frequency & wavelength in a rectangular waveguide working on TE10 mode; (iv) To study the square law behavior of a microwave crystal detector.
17. To determine the specific charge (e/m) of an electron.
18. To determine the charge of an electron using Millikan oil drop experiment.
19. To determine the emission spectra of hydrogen atom.
20. To study the Kerr effect using Nitrobenzene

NUCLEAR AND PARTICLE PHYSICS

Course Code: PHY4321 **Credit Units: 04**

Course Objective: The aim of the course is to introduce the concept of nuclear structure, nuclear forces and nuclear reactions for a clear understanding of recent intricate theories of nuclear physics. Course Contents:

Course Contents:

Module-I:

Nuclear Properties and Radioactivity Nuclear radii and measurements, nuclear binding energy (review), Radioactive decays : Review of barrier penetration of alpha decay & Geiger-Nuttal law. Beta decays, Fermi theory, Kurie plots and comparative half-lives, Allowed and forbidden transitions, Experimental evidence for Parity-violation in beta decay, Electron capture probabilities, Double beta decay, Neutrino, detection of neutrinos, measurement of the neutrino helicity. Multipolarity of gamma transitions, internal conversion process, transition rates, Production of nuclear orientation, angular distribution of gamma rays from oriented nuclei.

Module-II:

Two-Body Problems and Nuclear Forces Properties of deuteron, Schrödinger equation for the deuteron and the ground state; rms radius, spin dependence of nuclear forces, electromagnetic moment of deuteron and the necessity of tensor forces. Nucleon-nucleon scattering, experimental n-p scattering data, partial wave analysis of n-p scattering, phase shifts, singlet and triplet potentials, effective range theory, low energy p-p scattering, meson theory of nuclear forces, Charge independence and charge symmetry; spin dependence, S-wave effective range theory; central and tensor forces, dipole and quadruple moments of deuteron.

Module-III:

Nuclear Reactions Compound nucleus and Direct reactions (elastic, inelastic, transfer, break-up), Nuclear fusion, Laser induced fusion, Quantum mechanical theory, Resonance scattering and reactions, Dispersion relation, Nuclear fission: experimental features, spontaneous fission, barrier penetration, statistical model.

Module-IV: Nuclear Structure and Elementary Particle Physics 15 Liquid drop model, Shell model (extreme single particle), magnetic moment, quadruple moment; Collective models; concept of unified model Elementary particles, Various quantum numbers and their conservation, Gellmann Nishijima formula, C, P and T invariance, applications of symmetry arguments to particle reactions.

LASER PHYSICS

Course Code: PHY4322 **Credit Units: 03**

Catalog Description
This course is intended to give knowledge of basic principle of working of lasers, types of lasers and applications.

Course Objective:
1. To develop understanding of construction and operation of different Laser systems.
2. To understand advances in laser physics and its applications

Course outcome
Through this course students will learn following:
1) Fundamental principles of stimulated emission and how to convert it into coherent light emission, types of lasers
2) The manipulation of light e.g. mode selection, non linear optics.
3) Applications of various lasers in various fields including scientific research.

Course Contents:
Module I: Basics of Lasers
Stimulated Absorption, Stimulated Emission and spontaneous Emission, Einstein Coefficients, Light Amplification and Threshold condition, Widths and Profiles of Spectral Lines: Homogeneous and Inhomogeneous Broadening. Natural Linewidth. Doppler Width. Collision Broadening of Spectral Lines.

Module II
Basic principles of LASERS Laser Amplification. Laser Oscillation. Optical and Electrical Pumping. Optical Resonators. Losses in Resonators. Resonance Frequencies of Optical Resonators. Laser Modes. Rate Equations for Three-Level and Four- Level Lasers, Single-Mode Operation: Q-Switching, Mode Locking, Basic ideas of chirped pulse amplification

Module III
Types of Lasers. Solis State lasers (Ruby laser, Semiconductor laser, Nd: YAG laser), Gas lasers (He-Ne laser, Excimer laser), Liquid (organic dye) lasers.

Module IV
Nonlinear Optics, Harmonic Generation, Phase matching, Third Harmonic generation, Parametric oscillator, Applications of lasers: Holography, Basic idea of Mach-Zehnder Interferometer and Laser induced Fluorescence

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

INTEGRATED PHYSICS LAB-III

Course Code: PHY4316 **Credit Units: 03**

Course Contents:

1. Fabrication of thermocouple and calibration of the same for the temperature measurement.
2. Production and characterization of plasma.
3. Determination of the transition temperature of the materials undergoing phase transition and calculation of the transition enthalpy.
4. Determination of Young's modulus of steel by flexural vibrations of a bar.
5. To measure numerical aperture and propagation loss and bending losses for optical fibre as function of bending angle and at various wavelengths.
6. To determine wavelength of a given laser source.
7. To determine the Diameter, Divergence and Focus Spot Size of a Laser Beam.
8. To measure the degree of polarization using laser.
9. To study Propagation loss & bending loss using Optical Fiber
10. To study the characteristics of LED & Detector using Fiber Optic.
11. To determine the numerical aperture of a given optical fiber.
12. To study the frequency modulation & demodulation by using Fiber Optic Link.
13. To determine the Planck's constant using photocell
14. To determine the mean wavelength of sodium light and to measure the wavelength difference (Äë) using Michelson interferometer
15. To study the spectral characteristics of the incident beam using Fabry Perot Interferometer
16. To find the intensity distribution of single, double and multiple slit by using Fraunhofer diffraction pattern
17. To measure the grating element of grating by Fraunhofer diffraction pattern.
18. To determine the thickness of a thin transparent sheet using Michelson Interferometer.
19. To verify the Fresnel's formula for reflection and refraction by using a plane refracting surface using Spectrometer.
20. To determine the effect of magnetic field on the polarization state in dispersive medium (Faraday Experiment).

SUMMER INTERNSHIP EVALUATION

Course Code: PHY4335 **Credit Units: 03**

Methodology:

Practical training is based on the theoretical subjects studied by students. It can be arranged within the college or any in any related industrial unit or in any research lab. The students are to learn various industrial, technical and administrative processes followed in the industry/research. In case of on campus training the students will be given specific tasks of synthesizing /testing/analysis/characterization. On completion of the practical training the students are to present a report covering various aspects learnt by them and give a presentation of the same.

Examination Scheme

Feedback from Industry:	20
Training Report:	40
Viva:	15
Presentation:	25
Total	**100**

DIGITAL ELECTRONICS AND MICROPROCESSORS

Course Code: PHY4306 **Credit Units: 03**

Course Objectives

The objective of this course is to

- To provide a detailed description of registers and counters, A/D and D/A converters, microprocessors and antenna action.
- To serve as the foundation for practical lab experiments.

Course Outcomes

On completion of this course, the students will be able to

CO1 Develop an understanding of the basic concepts of digital electronics- Boolean algebra and applications of logic gates.

CO2 Clearly define and explain different types of the flip-flops, registers and counters

CO3 Enumerate and explain the Analog-to-digital and Digital-to Analog Converters.

CO4 Explain the basics of the Microprocessor 8085 and 8086

Catalog Description

This course gives a comprehensive view of the digital electronics and its applications. It covers the basic idea of a microprocessor. The working principle and operation of the different types of logic gates, flip-flops, registers and counters, A/D and D/A converters will be studied in detail.

Course Contents:

Module I: Shift Registers and Counters **10 Lectures**

Universal Shift Register, shift counter, Ring Counter, D/A converter and A/D converter. Simultaneous and Counter method of A/D converter, Successive Approximation method, Seven segment LED display, BCD to seven segment decoder.

Logic Families: Transistor as a Switch, TTL integrated circuits, CMOS integrated circuit. Logic families and their characteristics, comparing Logic families, Interfacing. Introduction to VHDL and Programming techniques.

Module II: Introduction to Microprocessor **6 Lectures**

Microprocessor 8085: PIN Out and Signals, Internal architecture, Flags, Program counter. Introduction to 8085 Instruction Set: Data Transfer, Arithmetic & Logical Instruction, Branch and machine Code, OP-Code Format, Addressing Mode Timing Diagram. Machine Cycle.

Module III: Microprocessor: - Programming and Interfacing **10 Lectures**

Subroutine and Sub programming, CALL and RETURN, STACK, PUSH & POP, 8085 Interrupts, RST Code; SID, SOD, RIM and SIM; Delay Program Calculation, Memory Organization. (RAM, EPROM, ROM, PROM, DRAM.) Introduction to 8086 and registers. Addressing and Interfacing, Basic Interfacing Concept, Introduction to I/O and Memory Mapped Techniques, Handshaking, Interfacing I/O devices, Display, Keyboard, Generating Control Signals, De Multiplexing of address Bus, Programming Technique, Interfacing 8155, Programmable I/O Ports and Timer IC, Programmable Peripheral Interface 8255 with 8085. Interfacing of A/D and D/A converters, Study of 8279, 8253.

Module IV: Antennas **10 Lectures**

Antenna Action, Short Electric Doublet, Radiation from a Current Element, Thin Linear Antenna, Effect of Ground: Image Antenna, Short Vertical Grounded Antenna, Total Effective resistance and Efficiency of an Antenna, Yagi Antenna, Loop Antenna, Parabolic Reflectors, Antenna measurements, Broadband antenna principles, Practical Transmitting Antennas, Receiving Antennas,

RENEWABLE ENERGY RESOURCES

Course Code: PHY4317 **Credit Units: 03**

Course Objective:
This is an introductory course to renewable energy technologies and potentials to the Science students aiming to explain basic concepts of Renewable Energy resources.

Course Contents:

Module I: Energy & Thermodynamics & Environmental impact
Heat Transfer in Renewable Energy Systems - conduction, convection and radiation, thermal aspects of energy generation Work, heat, and the first law of thermodynamics. Heat engines and the second law of thermodynamics. The Carnot cycle. Applications of the second law to various energy transformation processes: heat pumps and refrigerators; different engine cycles. Use of fossil fuel, Energy crisis, Global Warming, Carbon emission and climate change. Need for sustainable development and Renewable Energy

Module II: Solar Energy (Thermal and Photovoltaic)
Solar energy option, Environmental impact of solar power, physics of the sun, Thermonuclear reactions , Black body radiation, Spectral distribution, the solar constant, radiation on titled surface / earth, Solar thermal Energy, Application of solar energy in Solar thermal and solar photovoltaic system, Brief introduction to 3 generation of Solar cells,

Module III: Ocean, tidal , wave energy
Principle of ocean thermal energy conversion (OTEC), setting of OTEC plants, thermodynamic cycles. Tidal and wave energy: Fundamentals of tidal power, Potential and conversion techniques, mini-hydel power plants. Use of tidal energy, Limitations of tidal energy conversion systems.

Module IV: Geothermal and Wind Energy
Structure of earth's interior, earthquakes & volcanoes, Geothermal resources, Hot springs, Steam ejection, Principal of working, Types of geothermal station with schematic representation, Applications.
Properties of wind, Availability of wind energy in India, wind velocity, Wind machine fundamentals; types of wind machines and their characteristics, Horizontal and Vertical axis wind mills, Elementary design principles, Coefficient of performance of a wind mill rotor, Aerodynamic considerations in wind mill design, Recent development and applications

Module V: Hydrogen Energy and Bio-Gas
Properties of hydrogen in respect of it's use as source of renewable energy, Sources of hydrogen, Production of hydrogen; electrolysis of water, thermal decomposition of water, thermo chemical production bio-chemical production. Storage Issues of Hydrogen, Applications of hydrogen energy.
Biomass: Raw materials, Properties/ characteristics of bio gas, Principles of Bio-Conversion; Photosynthesis, Anaerobic/aerobic digestion, types of Bio-gas digesters, gas yield, combustion, Transportation of bio gas, bio gas plant technology & status, Biomass cogeneration Energy recovery from urban waste, Power generation from liquid waste, Bio gas applications.

INTRODUCTION TO ASTROPHYSICS

Course Code: PHY4318 **Credit Units: 03**

Course Objective: To develop an understanding and appreciation of the laws of the Universe. A survey of modern astronomy covering topics about the solar system, galaxies, evolution of stars and methods used to explore the Universe.

Course Contents:

Module-I: Spectrum of EM radiation, and observation in different wavelength bands, atmospheric window. Different types of telescope, Limit of Resolution and resolving power.
Overview of major contents of universe, Black body radiation, specific intensity, flux density, luminosity, Apparent and absolute magnitudes, Bolometric magnitude, Basics of radiative transfer (Emission/absorption coefficients, source functions).

Module-II: Sun as a star: Basic parameters e.g. Solar constant, luminosity, effective temperature, mass, density etc.; Hydrostatic equilibrium, central temperature and pressure at centre of the Sun. Source of energy in the stars: Kelvin-Helmholtz timescale; possibility of thermonuclear reactions.

Module-III: Solar System: Various components of the solar system, Planets, their satellites, atmosphere at different planets, formation of the solar system.
The Galaxy: Size and shape of the Milky Way; interstellar extinction and reddening (qualitative); different types of Nebulae; orbits of stars and epicycle theory; stellar populations.

Module-IV: Morphological classification of galaxies; rotation curve and idea of dark matter; Active galaxies (basic understanding); clusters of galaxies and large scale distribution
Expansion of the universe; Hubble law and Hubble constant; Big-bang picture and Cosmic microwave background radiation (qualitative discussion).

EXPERIMENTAL TECHNIQUES

Course Code: PHY4410 **Credit Units: 04**

Course Objective: The objective of the present course is to introduce some advanced measurement, characterization and analytical methods commonly used in experimental physics research to the post graduate students.

Course Contents:

Module I: Vacuum Techniques: Basics: Introduction to vacuum technique, units, ranges, review of Kinetic theory of gases, Physical parameters at low pressures, Throughput, different vacuum pumps for production of low, medium, high and ultra- high vacuum. Vacuum gauges (Mc Leod, Knudsen, Pirani, Penning and Ionization gauges), Leak detection, Industrial & Scientific applications.

Module II: Diffraction and Microscopic Techniques: X-Ray diffraction, Electron diffraction, neutron diffraction, Transmission electron microscope (TEM), Scanning electron microscope (SEM), Energy dispersive X-ray analysis techniques (EDX). Atomic Force microscope (AFM), Surface Tunnelling microscopy (STM).

Module III: Spectroscopy & Thermal Techniques UV-VIS spectroscopy, photoluminescence, Infra-red spectroscopy, Raman spectroscopy, Photoelectron spectroscopy (XPS, UPS, AES). Thermal Techniques: TG, DTA, DSC. Scanning Thermal Microscopy (SThM)

Module IV: Accelerators & Detectors Van deGraff Accelerator, Tandem Accelerator, Linear Accelerator (LINAC), Cyclotron, Betatron, Synchrocyclotron, Synchrotron. Detailed study of Ionization chamber; Proportional counter, GM counter, Scintillation detector, photomultiplier tubes, photodiode, semiconductor diode detector.

NANO-SCIENCE AND TECHNOLOGY

Course Code: PHY4404 **Credit Units: 03**

Course Objective:
The objective of the present course is to introduce Nanoscience and nanotechnology. The course also provides the fundamentals of Nanoscience & nanotechnology and some of its applications. The course further provides the introduction of some of the Synthesis and characterization techniques.

Course Contents:

Module-I: Physics of Low-dimensional Materials -
Nano-materials and their types, Top down and bottom up approach. 1D, 2D and 0D confinement and Concept of quantum dots, quantum wires and quantum wells; Density of states for bulk materials, quantum wells, wires and dots; Importance of size distribution control, size measurement and size selection .

Module-II: Synthesis of Nanomaterials
Chemical methods: Sol-gel/Combustion method, Solvothermal, Chemical bath deposition Chemical vapour deposition, Homo- and hetero-nucleation growth methods, Co-precipitation method, Citrate precursor method. Sputtering and types:RF sputtering,DC sputtering and Magnetron sputtering. Thermal Evaporation, e-beam evaporation, Pulse Laser Ablation (PLD)

Module-III: Properties and Applications of Nanomaterials Physical and Mechanical properties of nanomaterials, Optical Properties, Electronic properties, Magnetic Properties, Electro-magnetic properties

Module-IV: Applications of Nanomaterials
Applications of carbon based nanostructured materials: CNT, Graphene and Fullerenes, Defense application, Medical Application, Mechanical Applications. Applications in communication, Water purification and Agriculture applications.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

ATMOSPHERIC PHYSICS

Course Code: PHY4405 **Credit Units: 03**

Course Objectives:
Several fundamental aspects related to Physics, Thermodynamics and Chemistry of the Atmosphere and Oceans will be introduced to the students in order to make them understand, and apply the knowledge to the physico-chemical processes that influence the weather and climate.

Course Contents:

Module-I: Thermodynamics
Thermodynamics of dry and moist air, atmospheric stability and dry adiabatic lapse rate, moist processes in the atmosphere, saturated and unsaturated ascent, moist adiabatic and saturated adiabatic processes in the atmosphere, saturated adiabatic lapse rate, pseudo adiabatic processes and equivalent potential temperature, conditional instability second kind, moist convection, aerosols, condensation processes, formation of cloud droplets, precipitation.

Module-II: Ocean Morphology
Ocean physics, thermodynamics of sea water, observed temperature, salinity, and density in the ocean, density stratification, water mass distribution, coastal currents and upwelling, thermohaline circulation. Oceans currents, coupling of surface and deep ocean waters, basic foundation of turbulence, turbulent flows, turbulent vorticity, turbulence pressure, eddy diffusivity, coherent structures, surface fluxes, air-sea interaction, mixing processes in the ocean.

Module-III: Earth-Atmosphere Radiation Balance
Radiative transfer in atmosphere and ocean: Sun and climate, Planck function, black-body radiation, local thermodynamic equilibrium, radiometric quantities, absorption and emission, Schwarzchild's equation, radiative equilibrium in a grey atmosphere, balance between incoming solar and outgoing
thermal radiation, role of aerosols, absorption by atmospheric gases, heating rates, net radiative heating, Radiative transfer in atmosphere-ocean system.

Examination Scheme:

GENERAL RELATIVITY & COSMOLOGY

Course Code: PHY4406 **Credit Units: 03**

Course Objective:
This subject aims to provide an introduction to cosmology, including the physics of the early Universe, dark matter and dark energy, and the evolution of the observed large-scale structure.

Course Contents:

Module-I
Newtonian Cosmology, Einstein's universe, Cosmological Principle, Olbers' paradox, Hubble's observations and Expansion of the Universe, Cosmological redshift, Einstein equation for cosmology, Friedman models.

Module-II
Angular diameter distance and luminosity distance as cosmological tools, cosmological models with Ë term, Radiation dominated and matter dominated solutions. Thermal history of the Universe, radiation dominated universe, Big-bang nucleosynthesis, recombination, decoupling of matter and radiation, Horizon problem, flatness problem, introduction to inflation.

Module-III
Formation of large scale structures: Density fluctuations, Jeans mass in expanding universe, evidence of dark matter, growth of fluctuations, Dark matter candidates. Alternative to Friedman cosmology,
Mach's principle, introduction to Brans-Dicke theory

Module-IV
Measurement of Hubble constant, various methods (e.g. Cepheid stars, Tully-Fisher relation, SNIa, Surface brightness fluctuations, Fundamental Plane relation) and recent results. Cosmic microwave background, spectrum and anisotropy, power spectrum of fluctuations, Sunyaev-Zel'dovich effect in galaxy clusters. Latest observations of SNe Ia and evidence of dark energy, Matter-energy of the Universe.

OPTICAL FIBERS AND COMMUNICATION

Course Code: PHY4407 **Credit Units: 03**

Course Objective:
The objective of the present course is to introduce fundamentals of optical fibers, detectors and amplifiers and their applications in Physics.

Course Contents:

Module-I: Optical Fiber Fundamentals
Light propagation in optical fiber, Acceptance angle and numerical aperture, Losses in optical fiber: absorption loss scattering loss, bending loss, and splice loss. Pulse propagation in dispersive medium, pulse broadening, Intermodal and intramodal dispersion, group velocity dispersion (material and waveguide).

Module-II: Modal Analysis of step index multimode and graded index fiber
Characteristics equation of step index multimode fiber, Transverse Electric (TE), Transverse magnetic (TH) and Hybrid modes, linearly polarized modes, V parameter, mode cutoff, Mode field diameter, Modal analysis of graded index fiber.

Module-III: Optical Sources, Detectors and Amplifiers
Types of Optical Sources, Light emitting diodes (LED), Edge emitting LEDs, Coupling of LEDs with fibers, Semiconductor Lasers; Detectors: Photoconductors, Photodiodes, Avalanche Photodiodes and Phototransistors, Amplifiers: Semiconductor Laser Amplifiers, characteristics, advantages and drawback, Erbium Doped Fiber Amplifier (EDFA), gain and noise in EDFA and noise figure.

Module-IV: Fiber Optical Communication Components and System
Coupling Components- couplers, connectors and splices, Modulators and Modulation methods, Transmitters, Receivers, Repeaters and switches; Transmitter, Receiver and link design, Line codes for optical fiber links, wavelength division multiplexing (WDM) and Optical Division Multiplexing.

Examination Scheme:

PHYSICS OF SOLAR PHOTOVOLTAICS

Course Code: PHY4408 **Credit Units: 03**

Course Objective:
In this course, one would learn about the fundamentals of photoelectric conversion: charge excitation, conduction, separation, and collection. You will become familiar with commercial and emerging photovoltaic (PV) technologies and various cross-cutting themes in PV: conversion efficiencies, loss mechanisms, characterization, manufacturing, systems, reliability, life-cycle analysis, and risk analysis

Course Contents:

Module I: Solar Cells and Sunlight
Outline of solar cell development, physical source of sunlight, review of solar intensity at the Earth's surface, solar insolation data

Module II: Review of Semiconductor Properties
Crystal structures and orientations, forbidden energy gaps, dynamics of electrons and holes, carrier density, carrier transport, generation and recombination of carriers due to light, direct and in-direct band gap semiconductors, basic device physics, p-n junction diode,

Module III: Standard Silicon Solar Cell Technology (1 st generation solar cells)
Photovoltaic effect , solar cell output parameters, characteristic lifetime, diffusion length, diffusion coefficient, absorption coefficient, efficiency limits, losses, and measurements. Review of fabrication technology, polysilicone and single crystal silicon cell technologies. Design of Solar Cells , Solar cells to solar module

Module IV: Thin Film Solar cells (2nd – Generation)
Polysilicone silicon, amorphous silicone, gallium arsenide solar cells, copper sulfide and cadmium sulfide solar cells, potential & drawbacks of currently manufactured technologies (single- and multicrystalline silicon, CdTe, CIGS, CPV)

Module V: Emerging Solar Cells technologies and concepts (3rd –Generation)
Organic solar cells, Dye-sensitized solar cells, Perovskite solar cells, GaAs solar cells, Thermo-photovoltaic approaches to overcome single junction efficiency limits, spectrum modification approaches, hot carrier solar cells, Quantum Dot solar cells

Examination Scheme:

Components	CT	Assignment	Attendance	EE(1)
Weightage (%)	15	10	05	70

BIOPHYSICS

Course Code: PHY4409 **Credit Units: 03**

Course Objective:
This course aims at exposing the students to basic Biophysics concepts which will be useful for them to solve the integrated problems of Biology and Physics.

Course Contents:

Module I: General Biophysics and Techniques in Biophysics
Fundamentals of Biophysics, Surface tension, Adsorption, Osmosis, Osmotic pressure, Dialysis, Colloids, Colloidal systems of life, Buffer, Buffer capacity, Buffers in life system, pH, its importance, Basics of spectroscopy, X-ray crystallography, NMR, UV etc

Module II: Molecular Biophysics
Different levels of protein structure, Primary, secondary, tertiary and quaternary structure. Main chain and side chain torsion angles, Alpha helix, beta sheet, turns. Ramachandran plot , Allowed conformations for a pair of linked peptide units, Motifs and domains.

Module III: Thermodynamics
Laws of thermodynamics, concept of free energy, unavailable energy and entropy, heat content of food, bomb calorimetry, chemical kinetics – rate, order, molecularity of reactions and energy of activation

Module IV: Simulations, Data Analysis and Visualization
Advantages and challenges in simulations of Biophysics, Basics of simulation software such as NAMD and/or GROMACS, Data Analysis of simulation generated data, Visualization software such as PyMol and VMD

Examination Scheme:

RADIATION PHYSICS

Course Code: PHY4411 **Credit Units: 03**

Course Objective:
The objective of the course on Radiation Physics is to expose the students to the concepts of different kinds of radiations, their interaction with matter, radiation detection and radiation dosimetry. The course will enable students to understand that interaction of matter with different kinds of radiations such as charged particles, electrons, neutrons, EM waves etc. and further their technological applications primarily as radiological applications.

Course Contents:

Module I: Radiation Sources
Basic units and definitions, Fast electron sources: beta decay, internal conversion & Auger electrons; Heavy charged particle sources: Alpha decay & spontaneous fission; Sources of electromagnetic radiation: Gamma rays following beta decay, Annihilation radiation, Bremsstrahlung, Characteristic X-rays & Synchrotron radiations; Neutron sources: Radioisotope sources & photoneutron sources

Module II: Radiation Interaction
Interaction of heavy charged particles: Nature of interaction, stopping power, energy loss characteristics, The Bragg curve, Energy straggling, Range & Range straggling, Energy loss in thin absorbers; Interaction of fast electrons: Specific energy loss, Electron range and transmission curves, Interaction of gamma rays: Photoelectric absorption, Compton scattering, Pair production; Interaction of neutrons: Slow neutron & fast neutron interaction; Radiation exposure and dose: Gamma ray exposures, Absorbed Dose, Dose equivalent,

Module III: Radiation Detectors and Spectroscopy:
General characteristics of detectors: Detector model, Modes of detector operation, Energy resolution, Detector efficiency; Gas filled detectors, Organic and inorganic scintillation detectors, Semi-conductor detectors [Si(Li), Ge(Li) HPGe]. Photomultiplier tubes, Gamma ray spectrometers, Gamma ray spectrometry with NaI(Tl) scintillation and semiconductor detectors; Background and detector shielding.

Module IV: Radiation Dosimetry
Radiation dosimetry, its types and applications: Environmental, space, personal and medical dosimetry; General properties of dosimeter; Thermoluminescence (TL) and its mechanism; TL dosimetry: TL glow curve and TL spectra; Concept of trapping parameters: activation energy, order of kinetics & frequency factor; TLD protocols, optically stimulated luminescence (OSL) based dosimetry

Examination Scheme:

HIGH ENERGY PHYSICS

Course Code: PHY4413 **Credit Units: 03**

Course Objective:
The aim of the course is to introduce the basic concepts of elementary particle physics and quantum field theory for a clear understanding of the universe at very fundamental level. Further, the students will be able to gain knowledge of the important concepts which are used in modern day particle physics experiments.

Course Contents:
Module I: Basic Concepts
Natural units, Cosmological origin of universe, Fundamental building blocks and interactions, Historical introduction to particle zoo, Cross section, Decay rate, Pseudo-rapidity, Discrete and Continous Symmetries, Isospin, Strangeness, Hypercharge, Parity, Meson and Baryon Octet, Baryon Decuplet, Eight-fold way, Charge Conjugation, Time Reversal, CP symmetry, CPT theorem, Feynman diagrams, Collider physics, Integrated Luminosity, Hybrid detectors.

Module II: Standard Model of Particle Physics
Gauge theory, Local and global symmetry, Spontaneous breaking of symmetry, Abelian and Non-Abelian gauge fields, Goldstone theorem, Higgs mechanism, Higgs field and coupling to three generations of matter, Gauge boson and fermion mass generation via spontaneous symmetry breaking, Elementary idea of CKM matrix, Basic introduction of Glashow-Weinberg-Salam theory.

Module III: QCD and Quark Model
Deep inelastic scattering, Quark model, Asymptotic freedom, Color confinement, Hadron formation, Flavor symmetry.

Module IV: Basic Idea of Beyond Standard Model Physics
Neutrino – types, oscillation and mass, Elementary idea of Supersymmetry & String theory, Dark matter & Dark Energy, New Physics.

FCH4103	FORENSIC PHYSICS	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to give insight of providing the basic knowledge about the physical evidence and its forensic applications. The students will be able to correlate the speed of vehicle in hit-n-run cases with skid marks analysis and paint examination. The course will help the students to differentiate between different fractures of glass.

Course Objective:

This course will cover:

1. Important physical evidences found at crime scene.
2. General characteristics and identification of physical evidences.
3. Examination and evidential value of important physical evidences.

Course Outcomes

On completion of this course, the students will be able to

CO1. Analyse the soil as evidence and to define the significance of its types, particle size and density in crime cases.

CO2. Identify and differentiate between various types of glasses and fractures.

CO3. Explain the importance of paint as evidence and its significance in hit-n-run cases.

CO4. Analyse the types of Tool marks and restoration of erased/ obliterated marks and their lifting and comparison.

CO5. Apply the analysis techniques like chromatography and spectroscopy for physical evidences.

Course Contents	Blooms level*	Number of hours
Module I: Soil Formation and types of soil, composition of soil, particle size distribution, composition and analysis of concrete, cement, and its types.	L1, L2	**7**
Module II: Glass Types of glass and their composition, Forensic examination of glass fractures, determination of direction of impact: cone fracture, rib marks, hackle marks, concentric and radial fractures.	L1, L2, L3, L4	**7**
Module III: Paint Types of paint and their composition, macroscopic and microscopic studies, pigment distribution, micro-chemical analysis. Importance of paint evidence in hit and run cases; Importance of fiber evidence; Forensic gemology	L1, L2, L3, L4	**7**

Prof. (Dr.) Anil Kumar

Manesar Gurgaon-122413

Module IV: Tool Marks & Restoration of Erased / Obliterated Marks Types of tool marks: compression marks, striated marks, combination of compression and striated marks, repeated marks, class characteristics and individual characteristics, tracing and lifting of marks.	L1, L2, L4	**7**
Module V: Analysis Techniques **Soil**: microscopic examination, density gradient analysis, interpretation of soil evidence **Glass**: colour and fluorescence, physical matching, refractive index, and interpretation of glass evidence. **Paint**: Pyrolysis Chromatographic techniques, IR spectroscopy and Raman spectroscopy, interpretation of paint evidence, solubility test, Thin layer chromatography **Tool Marks**: Photographic examination of tool marks. Method of making-cast, punch, engrave; methods of obliteration, method of restoration.	L1, L3, L4	**8**

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Modes of Evaluation: Quiz/Assignment/ Seminar/Written Examination

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

FCH4106	FORENSIC BALLISTICS	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description
The course is designed to provide basic and analytical knowledge of the firearms, types, firing range and the analysis of the GSR components.

Course Objective: - The objectives of the course:
1. To understand the basics of the projectile motion, ballistics, and role of ballistics in Forensic Science
2. Classification of different types of firearms and explosives.

Course Outcomes
On completion of this course, the students will be able to
CO1. Explain the history and types of Firearms
CO2. Describe various types of ammunition
CO3. Explain about the Internal and External ballistics.
CO4. Restate the concept of linkage of bullets and Cartridge Cases.
CO5. Describe the Gun Shot Residue and determination of range of firing.

Course Contents	Blooms level*	Number of hours
Module I: Introduction to Ballistics: Definition and scope, Firearms, Indian Arms Act, Types of evidences associated, History and mechanism of Muzzleloaders (Match lock, Wheel lock, Flint lock firearms), Briefs of Pinfire, Rimfire and Centrefire systems of cartridge, Characteristic features of the firearms, various types of modern firearms, classification of firearms on different basis, bore characteristics Different parameters of classification of firearms, Introduction to Shotgun, Revolver, Pistol, Rifle and Country Made/ Improvised Firearms. Proof marks of weapons.	L1, L2	7
Module II: Firearm Ammunition: Ammunition Components of Shotgun and Rifled firearm cartridges, Headstamp markings on ammunition. Various types of bullets and their compositional aspects, latest trends in their manufacturing and design, smooth bore, and improvised ammunition.	L1, L2, L3, L4	7

Module III: Internal and external Ballistics: Internal Ballistics: Definition, shapes and manner of Propellant burning, Muzzle velocity and Factors affecting muzzle velocity, ballistic coefficient, phenomenon of ricochet External Ballistics: Definition- Bullet Trajectory and factors affecting bullet flight. Wound Ballistics: Definition of wound ballistics, Ballistic aspect of firearm injuries, significance of studying cavitations in body, Bullet Entry/Exit Hole Identification, Evaluation of accident, suicide, homicide firearm injuries.	L1, L2, L3, L4	**7**
Module IV: Bullet linkage: Different types of marks produced during firing process on bullet-number/direction of lands and grooves, width of lands and depth of grooves, angle and pitch of rifling, striation marks on lands and grooves, techniques for obtaining test material from various types of weapons and their linkage with fired ammunition, class, and individual characteristics.	L1, L2, L4	**8**
Module V:Range of Firing determination: Introduction and methods of estimation. Gunshot Residue: Introduction and methods of analysis. Bullet and Cartridges matching: Ejecta, burning, scorching, blackening, tattooing and metal fouling, shots dispersion and GSR distribution, time of firing – different methods employed, and their limitations, stereo & comparison microscopy, automatic bullet, and cartridge comparison.	L1, L3, L4	**7**

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

FCH4107	FORENSIC PHYSICS – LAB	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	4	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description:
The course includes the analytical techniques for physical evidences like soil, glass, paints etc. The course has practical of casting of tyre marks and shoeprints, comparison of bangles and fibres.

Course Objective: The students will understand & perform experiments relating to:
Examination of physical properties of physical evidences commonly encountered at the crime scene.

Course Outcomes
On completion of this course, the students will be able to
CO1. Examine physical evidences (soil) by different analytical methods
CO2. Examine physical evidences (Glass) by different analytical methods
CO3. Perform comparative analysis of paints by TLC
CO4. Cast of different marks and a1nalyse fibres and bangles.

Course Contents: Lab/ Practical	Blooms level	Number of hours
1. Examination of physical properties of Soil by microscopy 2. Solubility test for paints and soil 3. Size distribution analysis of soil particles. 4. Mineral test for soil	L1, L3, L4	12
5. Examination of physical properties of Glass by microscopy 6. Comparative analysis of Glass fragments/ examination of glass fractures	L1, L3, L4	8
7. Comparative analysis of paints by TLC	L1, L3, L4	6

FCH4108	CRIME SCENE INVESTIGATION (CSI) – LAB	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	4	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide basic knowledge of practical aspects of analysis and reconstruction of crime scene to the students. The students will understand the basic requirements for the crime scene investigation. They will understand the significance of crime scene sketching and photography. The course will help the student to understand proper collection and preservation of the evidence and their presentation in court of law.

Course Objective: The course focuses on following objectives-

- Developing an understanding and application of Crime Scene Investigation.
- Develop an understanding on processing of crime scene (searching, sketching and photography of Crime scene (Indoor and Outdoor).
- Brief description on procedure adopted for collection, preservation, and packaging of Physical evidences.

Course Outcomes

On completion of this course, the students will be able to

CO1. Practically do the sketching and searching of all types of crime scenes.
CO2. Perform photography with efficiency in different types of crimes.
CO3. Analyze different types of evidence and their proper collection and preservation techniques.
CO4. Justify by proper Presentation of the evidences in the court of law and significance of chain of custody.

Course Contents: Lab/Practical	Blooms level	Number of hours
1. Camera and its parts	L1, L2	6
2. Sketching of the indoor crime scene 3. Sketching of the outdoor crime scene	L1, L3, L4	12
4. Photography of the indoor crime scene 5. Photography of the outdoor crime scene	L1, L3, L4	12
6. Collection, packaging and forwarding of trace evidences by Druggist fold method. **7.** Collection and preservation of various physical evidences (Fingerprint, blood, saliva, fibre, hair etc.)	L1, L3, L4	12
8. Forwarding of physical evidences	L1, L2, L3	6

FCH4111	FORENSIC AND CRIMINAL INVESTIGATIONS	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Expos					
Co-requisites					

Catalog Description

This course is intended to provide basic knowledge of the crime scene, type of evidence and their significance in forensic investigations. It will be helpful in providing the students a basic connection between crime and the sequence of events that will help them to reconstruct the crime scene. The course will help the student to understand the significance of evidence in expert testimony and presentation of the evidence in court.

Course Objective: The course focuses on following objectives-

- Developing an understanding and appreciation of the scope of Crime Scene Investigation and Management.
- Develop an understanding on handling of different physical evidences found at the crime scene
- Develop comprehensive knowledge on various investigative techniques used in processing the crime scene.

Course Outcomes

On completion of this course, the students will be able to

CO1. Communicate the concept of crime scene, its types and significance in forensic science.

CO2. Investigate crime scene Investigation and do crime scene processing along with knowledge of various techniques used for recording of a crime scene

CO3. Apply his/her comprehensive knowledge on Physical evidence, testimonial and real evidences and the crime scene reconstruction and significance of crime scene reconstruction along with their admissibility in court.

CO4. Apply investigative and interrogative methods in order to obtain information from criminals and to familiarize students with Expert testimony, its role and acceptance of evidence in the court.

Course Contents:	Bloom s level	Number of hours
Module I: Introduction to Forensic Science Introduction and history of Forensic Science, Basic principles and significance, Utilization of Forensic Science, Forensic scientist at the scene of crime, Structure of Forensic labs, ethics in forensic science, Forensic Science in International perspectives, including set up of INTERPOL and FBI	L1,L2	7
Module II: Crime Scene Management Definition and causation of crime, Types of crime scene, Crime scene survey, protection of crime scene, searching of physical evidences, Recording, documentation and presentation in the court, processing, and reconstruction of the crime scene.	L1, L2, L3	8

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Module III: Physical Evidences Physical evidences and its types (fingerprints, glass, fibre, blood, saliva, weapon of crime etc.), Blood spatter analysis, Characteristic blood patterns, testimonial and real evidence, admissibility of scientific evidence and importance of physical evidences, Collection, preservation, packing and forwarding of different types of evidences to the laboratories.	L1,L2	11
Module IV: Investigation and Interrogation techniques Interviewing of the criminals; methods used by the police in getting information from the criminal; the ethical issues related to the same. Criminal profiling, Portrait Parley, Polygraphy, Narcoanalysis, Brain Fingerprinting, Modus operendi, Speech signal processing and pattern recognition – basic factors of sound in speech, acoustic characteristics of speech signal	L1, L2,	10

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

FCH4112	INSTRUMENTATION (CHEMICAL)	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description
Instrumental Analysis provides a sound knowledge of the various analytical techniques used to examine different kinds of evidence recovered from scene of crime in forensic cases. It develops the ability to analyze different kinds of physical evidence of forensic importance.

Course Objective The objective of the course is to provide student with practical understanding of working and applications of various instrumentation techniques used in the forensic science laboratory for the chemical analysis of evidences.

Course Outcomes
On completion of this course, the students will be able to
CO1: Communicate the concept, basic principle, and instrumentation of various chromatographic techniques.
CO2: Describe the concept, basic principle, and instrumentation of mass spectrometry.
CO3: Explain the potential utility of computers in instrumentation.
CO4: Analyse the signal and will be able to do measurement and data analysis.

Course Contents:	Blooms level	Number of hours
Module I: Chromatographic Techniques Basic principle, instrumentation, and forensic applications of Paper chromatography, Column chromatography, TLC, High pressure thin layer chromatography.	L1, L2, L3	9
Module II: Advanced Chromatographic Techniques Gas chromatography, Ion-exchange chromatography, Exclusion (permeation) chromatography, Affinity chromatography, HPLC, High pressure liquid chromatography, Interfacing GC with IR spectrometry	L1, L2, L3, L4	9
Module III: Mass Spectrometry Sample flow, Ionization methods, Mass analyzers, Vacuum systems, Signal processors, Detectors, Data handling, Correlation of mass spectra and molecular structure, Tandem mass spectrometry, GC-MS, LC-MS, Forensic applications of mass spectrometric methods.	L1, L2, L3, L4	9
Module IV: Measurements, Signals and Data Introduction, Noise, Signal-to-noise ratio, Sensitivity and detection limit, Sources of noise, Signal-to-noise enhancement, Evaluation and measurement, precision, Accuracy and instrument calibration, Data representation, The Automated Laboratory, Molarity, Molality, Mole fraction, Normality	L1, L2, L3, L4	9

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

FCH4110	RESEARCH SEMINAR	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	0	1
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

Seminar is a lecture series to acquaint new graduate students with departmental research (This one will be running through out first semesters on every Monday any Lecture, where normally Ph.D. students /internal Faculties /external speakers will give talks on their research or other topic of their specialization). The trainer must make sure that the aspects covered are practically practiced by the participants. The evaluation will be done by Board of examiners comprising of the faculties.

Course Objectives

A seminar is primarily an academic event that is organized to provide the students a one-to-one hands-on experience on any aspect of their learning for research-based activity. Prerequisite, graduate studying in Chemistry/ Biochemistry/ Forensic Sciences on consent of instructor. Seminar to acquaint new graduate students with departmental research (This one will be running through out first semesters on every Monday any Lecture, where normally Ph.D. students /internal Faculties /external speakers will give talk on their research or other topic of their specialization).

The trainer must make sure that the aspects covered are practically practiced by the participants. The evaluation will be done by Board of Examiners comprising of the faculties.

Course Outcomes

On completion of this course, the students will be able to

CO1: Explain significance of research and will get an idea of current research trends in Forensic and allied sciences.

CO2: Acquaint with departmental research.

CO3: Perform in the potential seminar-based evaluations.

Major Themes for Seminar

The seminar may be conducted on any of the following major themes:

- Forensic Science & its related laws
- Criminal Investigations & its proceedings
- Forensic Chemistry
- Forensic Physics
- Forensic Ballistics
- Forensic Fraud Investigations
- Forensic Document Examinations
- Investigative Techniques
- Forensic Analytical Techniques
- Forensic Medicine & Odontology
- Forensic Anthropology Examinations
- Cyber & Digital Forensics
- Any other relevant topics

These themes are merely indicative and other recent and relevant topics of study may be included.

FCH4201	FORENSIC PHOTOGRAPHY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Course Objective: This course is designed to:

- Provide foundation knowledge of photography
- Develop an understanding and application of Photography in Forensic Science and CSI

Course Outcomes

On completion of this course, the students will be able to

CO1. Understand the basic principles of photography.

CO2. Learn about the history and development of photography, developing techniques and methods of photography.

CO3. Learn about the indoor and outdoor crime scene photography and use of photograpy in the reconstruction of crime scene.

CO4 Understand about the I.R and U.V illumination in Photography.

CO5. Learn about the working principles of digital Photography and Videography

Course Contents	Blooms Level	Number of hours
Module I: Introduction Introduction to forensic photography; required equipments for photography – Camera, lens, shutter, depth of field, film; Importance of Forensic photography in a crime scene investigation	L1, L2	**4**
Module II: Types of Photography and Photo Prints History and development of photography. Basic principles and techniques of Black &white and colour photography. Developing techniques and methods of photography, Different kinds of developers and fixers, modern developments in photography, linkage of cameras and film negatives.	L1, L2,	**5**
Module III: Photography of various crime scenes Photography in indoor and outdoor scene of crime. Aerial photography. Surveillance photography – Cameras and accessories for surveillance photography, moving surveillance on foot, 2-person foot surveillance, surveillance with vehicles, fixed surveillance. Use of photography in reconstructing the scene of crime and its presentation in the court of law.	L1, L2, L3	**5**
Module IV: Guidance Documentation Image magnification, U.V. and I.R. illumination in Photography. Photography of Artefactual evidences (Bloodstain, fingerprint, imprints, and micro evidence).	L1, L2, L3	**5**
Module V: High-tech Photography for Crime Scene Digital photography, working principle of digital camera works and basics of digital imaging. videography/ high speed videography, High-speed photography, legal aspects of visual evidence.	L1, L2, L3	5

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

FCH4202	ELEMENTS OF FORENSIC MEDICINE AND ODONTOLOGY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Course Objectives:

During the course the student will

- Understand and appreciate the scope of forensic medicine**.**
- Know about different types of injuries, causes and manner of death and their medico legal significance
- Learn about the utility of the odontological studies in identification and other medico legal purposes like age, sex, and population Determinations.

Course Outcomes

On completion of this course, the students will be able to

CO1. Describe various physiological and chemical changes after death and will be able to estimate time since death

CO2. Identify the type of wound and its causes, also they can estimate the age of injury.

CO3. Identify type of dentition and can estimate the age, sex, and race of individual by analyzing the given teeth.

CO4. Analyse the types of bitemarks and their significance in identification of culprit and type of crime.

CO5. Explain different types of injuries and their causes and medico-legal significance.

Course Contents	Blooms level	Number of hours
Module I: Introduction to Forensic Medicine Definition of forensic medicine, cause, manner and characteristics of death. Autopsy, Post- mortem changes, Importance of canvass form; Handling buried body cases	L1, L2, L3	6
Module I: Wounds and its medico legal significance Basic injury production and healing mechanisms, Mechanical injuries (Abrasions, Bruises, Lacerations, Incised and stab wounds) and their medico legal significance, Importance of hesitation marks.	L1, L2, L3	8
Module III: Causes and manner of death Deaths due to Asphyxia, Fire, Electrocution. Various sexual offences.	L1, L2, L3	8
Module IV: Forensic Odontology - I Introduction to Forensic Odontology, Types of dentitions, Basic structure of human teeth, types of teeth & their morphology, Determination of age from teeth using various methods, Dental anomalies and their role in personal identification.	L1, l2, L3, L4	9

FCH4205	QUESTIONED DOCUMENTS	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

Questioned Documents deals with the examination of different kinds of questioned documents encountered in forensic cases. It provides a sound knowledge of the various aspects of questioned document examination. It develops the ability to analyze and resolve the crime mysteries involving forensic documents.

Course Objective: The course focuses on following objectives-

- Developing an understanding and appreciation for the scope of Questioned Documents.
- Develop an understanding on different types of questioned documents, the types of forgeries and disguise generally encountered.
- Give brief description on various methods of their detection and examination.

Course Outcomes

On completion of this course, the students will be able to

CO1: Understand the concept of questioned documents and its examination.
CO2: Learn various types of forgeries and examination of charred documents, sequence of strokes.
CO3: Learn different methods to determine age of questioned documents and examination of printed and photocopy documents.
CO4: Learn different instruments used to examine questioned documents.
CO5: Understand the concept of forensic report including its format and preparation.

Course Contents:	Blooms level	Number of hours
Module I: Questioned Documents Definition, Importance, Classification and preliminary examination of questioned documents. Handwriting: definition, development, Instruments and Appliances of handwriting expert. Handwriting Characteristics: General Characteristics, Individual Characteristics, Development of Individuality in Handwriting, digital questioned documents and their examination.	L1, L2	9
Module II: Forgeries Forgery and its types and characteristics, identification, and examination of forgeries. Decipherment of secret indented and charred documents, Preservation of documents, Examination of seal and other mechanical impressions, examination of sequence of intersecting of strokes, Standards for Comparison and Disguise etc. Advantages and disadvantages of exemplar and non-exemplar samples	L1,L2, L3	7
Module III: Age of Document & Alterations Determination of Age of Document- Absolute/relative age, Alterations in the document: erasures, additions, overwriting and obliterations. Classification and working of typewriters alterations in typed text, , Comparison of Printed matter- Various printing processes**.**	L1, L2, L3, L4	10

FCH4206	FORENSIC MEDICINE AND ODONTOLOGY -LAB	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	4	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide basic knowledge of practical aspects of Forensic medicine to the students. It will be helpful in providing the students a practical knowledge of dentition, bite marks and their investigations and the basic connection between forensic science and law. The course will help the student to understand the physiological and chemical changes in various types of death and will be able in solving the crime.

Course Objective:

- Identification of individual teeth, dental charting.
- To identify individual by using dentition.
- Age estimation by dental evidences.

Course Outcomes

On completion of this course, the students will be able to

CO1. Describe the types of dentitions, characteristics of individual teeth that will help in criminal investigations and species identification.

CO2. Estimate age of person by teeth and x rays.

CO3. Correlate bite marks with species and individuals and type of crime and present in court of law.

CO4. Interpret the results of autopsy and its correlation with type of crime and type of evidences.

Course Contents: - Lab/Practical	Blooms level	Number of hours
1. Types of Dentitions a. Temporary b. Mixed c. Permanent	L1, L3, L4	16
2. Identification of individual teeth based on the morphological features.	L1, L3, L4	12
3. Estimation of age from the teeth. a. Living subject b. Maxilla & mandible c. From X-Rays	L1, L3, L4	10
4. Comparison and Identification of Individuals from bite marks a. Direct comparison b. By casting c. By photography	L1, L3, L4	8
5. Autopsy observation through visits and recording the files		2

FCH4208	QUESTIONED DOCUMENTS AND FINGERPRINTS – LAB	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	4	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide the basic knowledge about the instruments which can be used for the analysis of biological samples. The students will understand the basic principle of the instruments and will be able to apply different techniques as per the requirement of the investigations in medicolegal cases.

Course Objective: - The course focuses on following objectives-

- Developing an understanding and application on practical aspects of Questioned Documents and Fingerprints.
- Develop an understanding on procedure adopted for examination of different types of questioned documents, the types of forgeries, disguise and their examination along with giving appropriate conclusion on the basis of findings.
- Brief description on identification, analysis and examinations of various kinds of fingerprints and other impressions that are encountered on crime scenes.

Course Outcomes

On completion of this course, the students will be able to

CO1. Examine and comparison of security documents, fake currency and stamp papers.

CO2. Explain the procedure adopted for examination of different types of questioned documents, the types of forgeries, disguise and their examination along with giving appropriate conclusion on the basis of findings.

CO3. Develop different types of fingerprints and interpret the results.

CO4. Perform fingerprint development by different methods for the forensic investigations.

Course Contents: - Lab/Practical	Blooms level	Number of hours
1. Examination and comparison of security documents, fake currency and stamp papers. 2. Examination and comparison of disputed anonymous letter with specimen of suspect/suspects. 3. Identification of altered/added/obliterated/erased/handwriting on cheques and deeds.	L1, L2, L3, L4	12
4. Comparison of forged (disputed) signature with the specimen signatures. 5. Comparison of disguised (disputed) signature with specimen signatures	L1, L2, L3, L4	10

FCH4209	INSTRUMENTATION (BIOLOGICAL)	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide the basic knowledge about the instruments which can be used for the analysis of biological samples. The students will understand the basic principle of the instruments and will be able to apply different techniques as per the requirement of the investigations in medicolegal cases.

Course Objective: The objective of the course is to provide student with practical understanding of working and applications of various instrumentation techniques used in the forensic science laboratory for the analysis of biological evidences.

Course Outcomes

On completion of this course, the students will be able to

CO1. Explain various biological phenomena associated with Forensic Science and the utility of various biological changes in forensic science.

CO2. Describe the principle, types, and applications of the centrifugation in forensic science.

CO3. To understand the various types of electrophoresis for the analysis of biological and toxicological samples

CO4. Analyse the biological samples by immuno-electrophoresis.

CO5. Apply various types of microscopes for the forensic investigations

Course Contents:	Blooms level	Number of hours
Module I:General Principles of Biological/ Bio-chemical Analysis pH and buffers, Physiological solution, Cell fractionation. Genetic Manipulations, Enzymes used in genetic manipulation, Cloning procedures, Isolation of specific nucleic acid sequences – complementary DNA, Gene libraries, Colony hybridisation, Expression of genes	L1, L2, L3	11
Module II: Centrifugation Techniques Basic principles of sedimentation, Various types of centrifuges, Density gradient centrifugation, Preparative centrifugation, Analysis of sub-cellular fractions, Ultra-centrifuge- Refrigerated Centrifuges.	L1, L2, L3, L4	10
Module III: Electrophoretic Technique General principles, Factors affecting electrophoresis, Types of Electrophoresis- Agarose gel electrophoresis, Polyacrylamide gel electrophoresis, its types, Isoelectric focusing (IEF), Iso-electrophoresis.	L1, L2, L3, L4	9

Manesar Gurgaon-122413

Module IV: Immuno-chemical Techniques General principles, Production of antibodies, Precipitin reaction, Gel immuno-diffusion, Immuno-electrophoresis, Radio Immuno-assay (RIA), ELISA, Fluorescence Immuno-assay.	L1, L2, L3, L4	8
Module V: Microscopy Basic principles, Simple and Compound Microscope, Comparison Microscope, Phase Contrast Microscope, Stereoscopic Microscope, Polarizing Microscope, Fluorescent Microscopy, Scanning Electron Microscope (SEM) and Transmission Electron Microscope (TEM).	L1, L2, L3, L4	10

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	15	5	5	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; A: Attendance

FCH4210	FINGERPRINT SCIENCE	L	T	P	C
Version 1.2	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description
This course will help the students to understand basic of fingerprint science and their systematic classification.

Course Objective: The course focuses on following objectives-

- Developing an understanding and appreciation for the scope of Fingerprints Examination.
- Develop an understanding on various methods of development of Fingerprints.
- Develop comprehensive knowledge on fingerprint patterns, fingerprint classification, the various methods of fingerprint development- physical and chemical.

Course Outcomes
On completion of this course, the students will be able to

CO1. Identify and outline various types of fingerprints patterns
CO2. Distinguish and categorise characteristics of fingerprints for proper collection and preservation.
CO3. Classify fingerprints for case solving and matching of suspect prints with crime scene evidences.
CO4. Apply advanced knowledge of Automated fingerprints identification for forensic examination in court of law.

Course content:	Blooms level	Number of hours
Module I: Introduction to Fingerprints Dactylography, Dermatoglyphics and Dactyloscopy, Basis concepts of Fingerprint Science, Friction ridge skin, Morphogenesis of friction ridge skin, Primary dermal ridge development, Definition of fingerprint, History of fingerprint identification, Fingerprint as forensic evidence, Visible finger-marks, Latent finger-marks.	L1, L2	7
Module II: Classification of Fingerprints for Comparison purposes Pattern area, Core, Delta, Type lines, ridge characteristics, Fingerprint Pattern types: Essentials and its types: Loop, Arch, Whorl, Composites, Accidental patters etc., Ten Digit and Single Digit fingerprint classification.	L1, L2, L3	8
Module III: Methods of Taking Fingerprints From living and dead persons, preserving and lifting of fingerprints. Comparison protocols: Class and individual characteristics (Galton's details), different ridge characteristics, Standards of proof, Automatic Fingerprint Identification System (AFIS), Poroscopy and Edgeoscopy. Multimetal deposition technique; Physical developer technique; Importance of light sources in fingerprint science	L1, L2, L3, L4	7

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module IV: Fingerprint Developing Methods Chemistry of latent fingerprint residue, factor contributing to latent fingerprints, Methods of development of latent fingerprints using conventional methods– Powder (Black and grey, fluorescent, and magnetic), Fuming method, Vacuum metal deposition (VMD) method, Chemical method, Reagent chemistry and formulations, Photography of fingerprints**.**	L1, L2, L3, L4	7
Module V: Report Writing and Court Room Testimony Evidence and testimony in court, Information required by the Forensic expert, Components of forensic reports, Preparation of report, Presenting findings in a report, Expert and the rules of evidences, Daubert's challenges to fingerprints.	L1, L2, L3	7

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Examination Scheme:

FCH4231	TERM PAPER	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	0	1
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

Seminar is a lecture series to acquaint new graduate students with departmental research (This one will be running through out first semesters on every Monday any Lecture, where normally Ph.D. students /internal Faculties /external speakers will give talks on their research or other topic of their specialization). The trainer must make sure that the aspects covered are practically practiced by the participants. The evaluation will be done by Board of examiners comprising of the faculties.

Course Objectives

A seminar is primarily an activity based academic event that is organized to provide the students a one-to-one hands-on experience on any aspect of their learning for research-based activity. Prerequisite, graduate studying in Chemistry/ Biochemistry/ Forensic Sciences on consent of instructor. Seminar to acquaint new graduate students with departmental research (This one was for second semester students to attained and fourth semester students had to present on one selected topic of their choice or Ph.D. students/internal faculties /external speaker will give talk).

The trainer must make sure that the aspects covered are practically practiced by the participants. The evaluation will be done by Board of examiners comprising of the faculties. This one will be one time event in one semester.

On completion of this course, the students will be able to

CO1: Explain significance of research and will get an idea of current research trends in Forensic and allied sciences.

CO2: Acquaint with departmental research

CO3: Discuss the potential seminar-based evaluations

Major Themes for Seminar

The seminar may be conducted on any of the following major themes:

- Forensic Science & its related laws
- Criminal Investigations & its proceedings
- Forensic Chemistry
- Forensic Physics
- Forensic Ballistics
- Forensic Fraud Investigations
- Forensic Document Examinations
- Investigative Techniques
- Forensic Analytical Techniques
- Forensic Medicine & Odontology
- Forensic Anthropology Examinations
- Cyber & Digital Forensics

  Any other relevant topics

These themes are merely indicative and other recent and relevant topics of study may be included.

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

FCH4301	FORENSIC CHEMISTRY, TOXICOLOGY AND PHARMACOLOGY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended for students to understand about Forensic chemistry and its various aspects in related field. The syllabus contains the various analytical methods to examine alcoholic beverages along with its toxicity. It also contains the drug abuse in sports and doping, classification and routes of administration of poisons and extraction and isolation techniques of various drugs from biological viscera.

Course Objectives:

During the course the student will:

- Understand the scope of forensic chemistry, toxicology, and pharmacology
- Understand and appreciate the scope, diversity, and utility of a variety of chemical analysis
- Learn the principles of primary techniques used for forensic identification of various chemicals, drugs, and poisons

Course outcome

On completion of this course, the students will be able to

CO1. Explain the need and scope of Forensic chemistry & Toxicology.
CO2. Apply the analytical procedure of alcohol & their examination.
CO3. Differentiate between use and abuse of drugs and their laboratory analytical methods.
CO4. Classify the poison and identify them in forensic science laboratory.

Course Contents	Blooms level	Number of hours
Module I: Introduction to Forensic Chemistry Forensic Chemistry: Introduction, types of cases/exhibits, preliminary screening, presumptive test (colour and spot test), inorganic analysis, micro – chemical methods of analysis, Analysis of petroleum products.	L1, L2, L3	6
Module II: Toxicology of alcohol and Examination of Alcoholic Beverages Fate of alcohol in body, alcohol in the circulatory system, Breath test instruments, Field Sobriety testing, Examination of alcoholic beverages; Country made liquor, Illicit liquor. Analysis of blood for alcohol.	L1, L2, L3, L4	6
Module III: Drugs of Abuse Introduction, classification of drugs of abuse, drugs of abuse in sports and doping, narcotics drugs and psychotropic substances, designers drugs and their forensic examination, Drugs and Cosmetic Act, Excise Act, NDPS Act. Dose-response relationship; Importance of Lethal dose 50	L1, L2, L3, L4	6

FCH4302	FORENSIC BIOLOGY AND SEROLOGY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description
This course is intended to give insight of providing the basic knowledge about the anatomy and physiological changes in odontology. The students will be able to correlate the bite marks with type of crime. The course will help the students to differentiate between wound and their medicolegal studies.

Course Objective: This course will cover:
- The important biological evidences commonly found at crime scene
- Significance of forensic anthropology, and forensic botany.
- Importance of serology and DNA analysis in interpretation of crime.

Course Outcomes
On completion of this course, the students will be able to
CO1. Explain the significance of biological evidences in the forensic science.
CO2. Identify and differentiate different types of fibres and racial difference in the fibres.
CO3. Demonstrate features of skeleton system, explain peculiar features of the human skeleton and its significance in age, sex and race determination
CO4. Utilize various biological fluids for the crime investigation and individual identification.
CO5. Summarize significance and applicability of DNA fingerprinting in the forensic investigations

Course Contents	Blooms level	Number of hours
Module I: Hair and Fibre Structure of hair and its biochemical properties, Phases of hair growth, types of hair. Differences between animal and human hair, Forensic examination of different types of hair. Different types of fibres and their identification.	L1, L2, L3	7
Module II: Botanical Evidences and Diatoms Different botanical evidences of forensic significance: seeds, pollens etc. Diatoms: Classification, basic structure and morphology, forensic significance of diatoms, extraction methods, examination of wood	L1, L2, L3,	6
Module III: Forensic Anthropology Definition and scope of forensic anthropology, Human skeletal system, and types of bones. Estimation of age from skull and long bones, site, and side determination. Estimation of stature from skeletal remains. Determination of sex from skull, mandible, and pelvis.	L1, L2, L3, L4	7

Module IV: Forensic Serology Definition and scope of forensic serology. Nature, composition and functions of blood and other fluids. Collection, preservation and packing of biological fluids. Introduction to ABO, Rh, MN systems, Lectins – their forensic significance, Determination of secretor/ non secretor status.	L1, L2, L3, L4	8
Module V: DNA Profiling DNA Profiling: Introduction, molecular biology of DNA, polymorphism, DNA Extraction methods (Organic and Inorganic extraction, FTA cards), DNA typing systems- RFLP analysis, sequence polymorphism. Evaluation of results, analysis of STR, SNP and Mitochondrial DNA markers, Y-STRs, PCR amplifications, Forensic applications of DNA profiling, limitations of DNA profiling	L1, L2, L3	8

FCH4304	FORENSIC BIOLOGY AND SEROLOGY-LAB	L	T	P	C
Version 1.2	Date of Approval: Dec, 2021	0	0	4	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide basic knowledge of practical aspects of Forensic serology, anthropology, and botany to the students. It will be helpful in providing the students a practical knowledge of various biological and botanical evidence and their analysis and significance in forensic investigations to establish connection between crime and suspect.

Course Objective: This course will cover:

- The practical aspects of forensic biology, anthropology, and serology
- To collect, pack and analyse biological, anthropological, & serological evidences
- To document chain of custody, write laboratory reports pertaining to the examinations conduct presumptive and confirmatory tests for evidence

Course Outcomes

On completion of this course, the students will be able to

CO1. Perform various tests for the species and personal identification that can help criminal investigations.

CO2. Estimate age of person by anthropological examination.

CO3. Correlate the time, site and cause of the crime by the identification of the diatoms and its presentation in court of law.

CO4. Understand the types of fibres, their identification and utility in forensic identification of the person.

Course Contents: Lab/ Practical	Blooms level	Number of hours
1. Determination of species of origin from blood and other biological evidences using precipitin test 2. Presumptive and confirmatory tests for blood 3.Examination and identification body fluids 4. Gel Immuno-diffusion tests for species origin 5. Blood grouping from dried stains by Absorption Inhibition or Absorption Elution	L1,L2,L3,L4	12
6. Microscopic examination of hair for the determination of different types of medulla and scale 7. Microscopic examination of hair for the determination of species	L1, L2, L3, L4	12
8. Extraction /Isolation of Diatoms from water/soil and tissues	L1, L2, L3, L4	6

FCH4305	FORENSIC CHEMISTRY AND TOXICOLOGY - LAB	L	T	P	C
Version 1.1	Date of Approval: July, 2019	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended for students to perform various practical in the field of Forensic Chemistry & Toxicology, to isolate different toxic substance, perform thin layer chromatography of several drugs and cations and anions analyses.

Course Objective:

The students will understand & perform experiments related to:-

- Isolation techniques for different poisons
- Analysis of different poisons
- Spot tests for different cations and Anions

Course Outcome

On completion of this course, the students will be able to

CO1. Demonstrate the isolation techniques of different toxic substances.
CO2. Perform the TLC and analysis of various drugs and poisons.
CO3. Perform various tests to analyze cations and anions.

Course Contents: - Lab/Practical	Blooms level	Number of hours
1. Isolation techniques of different toxic substances 2. TLC of insecticides, Barbiturates and other drugs 3. Spot test of mercury, iron, copper, aluminium, cadmium, zinc and other metallic poisons	L1, L2, L3, L4	16
4. Analysis of volatile and non-volatile poisons 5. Analysis of vegetable poisons	L1, L2,	16
6. Spot test of nitrates, nitrites, carbonates, sulphates, sulphites, chlorates	L1, L2, L3, L4	16

Co-requisites					

Catalog Description
Research Methodology and Statistics provide the detailed knowledge about the concept of research methods and its utility in forensic science. It develops the ability to carry research in different fields of forensic science.

Course Objective: This course is designed to:

- Provide foundation knowledge of quantitative and qualitative research methods used in Forensic Sciences.
- Provide understanding of the use of survey, field, and qualitative research techniques to develop practice knowledge.
- Describe distributions in terms of shape, centre, and spread including the ability to construct visual displays of data (charting, graphing).
- Provide an understanding of and ability to use the basic principles of statistical inference.

Course Outcomes
On completion of this course, the students will be able to
CO1: Explain the types of research, methods of sampling used in statistics.
CO2: Apply different methods of data collection and statistical methods useful in forensic science.
CO3: Define the concept and types of parametric and non-parametric tests.

Course Contents:	Blooms level	Number of hours
Module I: Introduction to Research Research: Definition, motives and objectives, Types of Research, Research process, Defining the research problem, Research design.	L1, L2	7
Module II: Sampling Principles, methods: census and sample survey, sample design. Types of sampling, rationale for using a particular sampling procedure.	L1, L2, L3	7
Module III: Tools of Data Collection Observation, interview schedule, questionnaire, survey, case study methods	L1, L2, L3	5
Module IV: Statistics Introduction, Frequency distribution, class intervals, graphical presentation: Line graphs, bar diagram, histogram, pie chart; Measures of Central Tendency: mean, median, mode; Measures of dispersion: Range, Mean deviation, Quartiles, Percentiles, Variance and standard deviation. Skewness and Kurtosis, Pearson and Spearman correlation methods, Regression equations.	L1, L2, L3	10
Module V: Statistics II Tests of Significance, Normal distribution, Confidence level. Level of Significance, Parametric and non-parametric tests, F-test, t-test, Z-test, Chi square test, ANOVA.	L1, L2, L3, L4	7

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-*

FCH4316	INSTRUMENTATION (PHYSICAL)	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Course Objective: The objective of the course is to provide student with practical understanding of working and applications of various instrumentation techniques used in the forensic science laboratory for the analysis of evidences.

Course Outcome

On completion of this course, the students will be able to

CO1: Explain the principle and application of Spectroscopy.

CO2: Describe types of Molecular spectroscopy, their principle and instrumentation and application in forensic science.

CO3: Describe types of Atomic spectroscopy, their principle and instrumentation and application in forensic science

Course Contents:	Blooms level	Number of hours
Module I: Basic Concepts - Atomic & Molecular Spectroscopy Introduction to Atomic orbitals, spectra, Bohr Model. Quantum Theory, molecular orbital, types of molecular energies, vibrational and electronic spectra. Classification of spectroscopic methods.	L1, L2, L3	10
Module II: Molecular Spectroscopy **Ultra-violet and visible spectrophotometry**: Types of sources and stability, wavelength selection, filters, reference cells and sampling devices, detectors, resolution, qualitative and quantitative methods for detection (Single beam and double beam). **Infrared spectrophotometry**: Basic principle, Dispersive and non-dispersive instruments, FTIR, instrumentation, Forensic applications, correlation of infra-red spectra with molecular structure. **Raman spectrophotometry**: Basic principle, theory, instrumentation, forensic applications. **Fluorescence spectrophotometry**: Types of sources, structural factors, instrumentation, comparison of luminescence and UV-visible absorption methods.	L1, L2, L3, L4	13
Module III: Atomic Spectroscopy **Atomic absorption spectrometry**: Instrumentation and techniques, interference in AAS, background correction methods, quantitative analysis, Applications in Forensic Science. **Atomic emission spectrometry**: Instrumentation and techniques, arc/spark emission, comparison of ICP vs AAS methods, quantitative analysis, applications in forensic science. **X-ray spectroscopy**: X-ray absorption and fluorescence methods, X-ray diffraction, Applications in Forensic Science. **Neutron Activation Analysis:** Introduction, principle, theory, instrumentation, and forensic applications.	L1, L2, L3, L4	13

FCH4318	INSTRUMENTATION WORKSHOP	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	0	1
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

Instrumentation Workshop is a lecture series along with instrumental demo to acquaint new graduate students with departmental research (This one will be running through out first semesters on every Monday any Lecture, where normally Ph.D. students /internal Faculties /external speakers will give talks on their research or other topic of their specialization). The trainer must make sure that the aspects covered are practically practiced by the participants. The evaluation will be done by Board of examiners comprising of the faculties.

Course Objectives

A workshop/seminar is primarily an activity based academic event that is organized to provide the students a one to one and hands on experience on any aspect of their learning. The communication in a workshop must be necessarily two ways. The trainer must make sure that the aspect covered is practically practiced by the participants. The student will choose the option of workshop from amongst their concentration electives. The evaluation will be done by Board of examiners comprising of the faculties.

Course Outcomes

On completion of this course, the students will be able to

CO1: Explain the principle and application of instruments in forensic research and will get an idea of application of the recent instruments in Forensic and allied sciences.

CO2: Acquaint with departmental research.

CO3: Learn the potential seminar-based evaluations.

Major Themes for Workshop

The workshop may be conducted on any of the following major themes:

- Crime Scene Investigation
- Forensic Toxicology
- Forensic Anthropology
- Handwriting &Typewriting Analysis
- Crime Scene Investigation
- Criminology, Criminal Law &Police Administration
- Fingerprint Science
- Forensic Serology
- DNA Fingerprinting
- Wounds & its Medico-Legal Aspects

These themes are merely indicative and other recent and relevant topics of study may be included.

Guidelines for Workshop

The procedure for earning credits from workshop consists of the following steps:

i. Relevant study material and references will be provided by the trainer in advance.

ii. The participants are expected to explore the topic in advance and take active part in the discussions held

iii. Attending and Participating in all activities of the workshop

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

iv. Group Activities must be undertaken by students as guided by the trainer.
v. Evaluation of workshop activities would be done through test and quiz at the end of the workshop.
vi. Submitting a write up of at least 500 words about the learning outcome from the workshop.

Methodology

The methodology followed at the workshop could be based on any one or more of the following methods:

i. Case Study
ii. Simulation
iii. Quiz
iv. Quality analysis & characterization
v. Identification and preparation of materials

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Evaluation Scheme:

Attendance	Active Participation	Multiple Choice Questions/ Quiz	Solving the case/ Assignment/ Write up	Total
10	30	30	30	100

FCH4306	ADVANCED FORENSIC BIOLOGY AND ANTHROPOLOGY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide advanced of the forensic biology and anthropology. The students will understand the advanced analytical techniques. It will be helpful in providing knowledge of the various branches of biology and their direct applications in the criminal investigation.

Course Outcomes

On completion of this course, the students will be able to

CO1. Explain wildlife forensics, Wildlife life protection Act and significance of wildlife evidences for criminal investigations and species identification.

CO2. Describe various concepts of entomology and its forensic relevance

CO3. Apply various instruments for individual identification from skeletal remains and presentation of these evidence in court of law.

CO4. Develop comprehensive knowledge of Superimposition techniques, Facial reconstruction for Personal Identification

Course Objectives:

During the course the student will

- Understand and appreciate the scope of forensic biology and Forensic Anthropology
- Understand and appreciate the scope, diversity, and utility of a variety of Human, Animal and plant evidences and their examination
- Learn the primary technique used for identification of various biological evidences
- Acquire the knowledge on techniques presently being used in the forensic examination of biological evidences and skeletal remains

Course Contents	Blooms level	Number of hours
Module I: Introduction to Wildlife Forensics Introduction to wildlife forensics, Examination of pug marks, horn, skin, fur, hair, nail, and teeth. Identification of some endangered species of plants and animals. Wildlife life protection Act.	L1, L2	6
Module II: Forensic Entomology and Forensic Microbiology Collection of insects, Shipment of collected insects, Identification of insect and its stage of growth. Determination of the post-mortem interval or "time since death" in homicide investigations, Forensic Entomo-toxicology. Introduction to Forensic microbiology	L1, L2, L3	8
Module III: Forensic Anthropology Somatometry, Osteometry and Craniometry. Identification of individuals from skeletal remains, Collection, Handling, preservation of skeletal remains of forensic science and report writing.	L1, L2	7

FCH4319	FORENSIC GENETICS	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to give insight of providing the basic knowledge about the DNA, genes, and chromosomes. The students will be able to identify the genic origin of the sample and will be able to match the samples with relatives. The course will help the students to understand the concept of allele transfer and its forensic application.

Course Objective: This course is designed to:

- Provide foundation knowledge of genetics
- Provide understanding of the inheritance laws and gene interactions
- Provide understanding of mutation and genetic diseases

Course Outcomes

On completion of this course, the students will be able to

CO1. Explain the significance of biological evidences in the forensic science.
CO2. Describe concept of gene and chromosome and how these are transferred to next generation.
CO3. Describe concept of mutation and genetic variations and their utility in crime investigation.
CO4. Utilize their knowledge of DNA for establishing identity, species differentiation and Forensic genetic research.

Course Contents:	Blooms level	Number of hours
Module I:Introduction to Genetics Mendel's work and Laws of heredity, Test cross, Backcross, Incomplete dominance and simple problems, Structure of DNA and RNA, Structural organization of chromosome, Special types of chromosomes (Salivary gland and Lamp-brush chromosomes)	L1, L2	6
Module II: Cell Division and Linkage Cell cycle, Mitosis and Meiosis, Coupling and repulsion hypothesis, Mechanism of linkage and its importance, Linkage in Maize and Drosophila, Mechanism of crossing over and its importance	L1, L2	8
Module III: Interaction of Genes Supplementary genes, Complementary genes, Pleiotrophy, Lethal genes, Epistasis, Multiple Allelism	L1, L2	7
Module IV: Mutations Mutagens and their types (Physical, chemical, biological), Mutation: Definition and types, Spontaneous and induced mutation, Chromosomal and Gene Mutation, Mutations in plants, animals, and microbes for economic benefit of man	L1, L2, L3	7

FCH4317	CYBER FORENSIC AND COMPUTER APPLICATIONS	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Course Objective: The objectives of the course are to:

- Provide students with a technical skills and competencies in the field of forensic computing thus producing competent and confident graduates.
- Produce students who will have a hands-on knowledge and able to perform technical role in forensic computing field.
- Equip students with the right skills thus enabling them to adapt real working environment, while contributing positively to the society at large.

Course Outcomes

On completion of this course, the students will be able to

CO1. Describe the basis concept of computer.
CO2. Explain about the fundamentals of programming language and internet concept
CO3. Describe the basics of operating system and data storage devices.
CO4. Illustrate the biometric system and their pattern recognition.
CO5. Explain the cybercrime and their tools for analysis.

Course Contents:	Blooms level	Number of hours
Module I: Computer Fundamentals - I Computer characteristics and classifications, Concept of Computer Hardware, Concept of Computer Software	L1, L2	8
Module II: Computer Fundamentals - II Fundamentals of programming languages, Concept of Algorithm and Flow Chart, Networking, and Internet Concepts	L1, L2	6
Module III: Data Storage Fundamentals Data storage devices, Storage fundamentals (Sector, Cluster, FAT etc.), File System Concepts, Data Storage and recovery, Basics of Operating System Software, Understanding Storage Formats for Digital Evidences – Raw Format, Proprietary Formats, Advanced Forensic Formats. Data Acquisition of live system, Shutdown Systems and Remote systems. Digital Forensics Standard Operating Procedures. Software and Hardware Tools used in Forensic Analysis – Open Source and Proprietary tools.	L1, L2,L3	7
Module IV: Pattern Recognition and Biometrics Pattern Recognition and Biometrics – Face, Iris and retinal imaging, Speech recognition, finger and palm print, gait pattern, signatures, Pattern comparison, Image processing – Proactive Forensic science	L1, L2, L3, L4	7

Prof. (Dr.) Anil Kumar

FCH4310	ADVANCED QUESTIONED DOCUMENTS AND FINGERPRINTS EXAMINATION	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

Advanced Questioned Document Examination deals with the examination of different kinds of questioned documents encountered in forensic cases. It provides a sound knowledge of the various aspects of questioned document examination. It develops the ability to analyze and resolve the crime mysteries involving forensic documents

Course Objective: The course focuses on following objectives-

- Developing an understanding and appreciation for the scope of Questioned Documents Examination.
- Develop an understanding on different types of cases in questioned documents and different writing conditions.
- Brief description on case presentation and report writing.
- Develop comprehensive knowledge on advanced Instrumentation techniques used for examination.

Course Outcomes

On completion of this course, the students will be able to

CO1: Explain the concept of poroscopy and edgescopy.

CO2: Explain advanced Methods of Development of Latent Fingerprints

CO3: Perform evaluation and development of handwriting including forensic report including its format and preparation.

CO4: Explain different types of security documents and different instruments used to examine questioned documents.

Course Contents:	Blooms level	Number of hours
Module I: Introduction to Poroscopy and Edgeoscopy Introduction: Poroscopy and edgeoscopy, Fingerprints examination on the basis of poroscopy and its significance, evaluation of fingerprints on the basis of edgeoscopy and its significance in fingerprint field.	L1, L2	8
Module II: Advanced Methods of Development of Latent Fingerprints Automatic fingerprint identification system, application of radiations to examine latent fingerprints on various surfaces including skin, SPR, Phase transfer catalyst, DFO, Indanedione, Oil RedO, Factors affecting fingerprints.	L1, L2, L3	10

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

FCH4320	ADVANCED FORENSIC CHEMISTRYAND TOXICOLOGY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended for students to understand about Forensic chemistry and its various aspects in related field. The syllabus contains the various analytical methods to examine alcoholic beverages along with its toxicity. It also contains the drug abuse in sports and doping, classification and routes of administration of poisons and extraction and isolation techniques of various drugs from biological viscera.

Course Objective: - The objectives of the course:

- The student understands the basic pharmacodynamics, pharmacokinetic and toxicological principles underlying the actions of the various poisons encountered in forensic toxicology.
- To ensure that the student understand nature of the toxicological investigations undertaken in forensic laboratories.

Course outcome

On completion of this course, the students will be able to

CO1. Describe the mechanism of drug action and interactions in body.
CO2. Explain the drug movement and distribution in body & their examination.
CO3. Discuss the difference between use and abuse of drugs and their laboratory analytical methods.
CO4. Classify the poison and identify them in forensic science laboratory.

Course Contents:	Blooms level	Number of hours
Module I: Pharmacology-I Sites and mechanisms of action of drugs, Dose-effect relationships; agonists, partial agonists, and antagonists. Factor modifying drug actions; side effects, overdose, idiosyncratic and allergic reactions; teratogenesis and foetal toxicity. Drug interactions.	L1, L2	6
Module II: Pharmacology-II Movement of drug molecules across cell membranes, Blood-brain barrier and Placental filter. Routes of administration and drug adsorption. Binding to plasma proteins. Drug distribution, metabolism and elimination. Drug bioavailability and half-life.	L1, L2, L3	**7**
Module III: Toxicology and Isolation techniques of toxins Definition of Toxicology, Principle of toxicology, Isolation of toxic substances from viscera and other relevant materials. Role of drug recognition expert.	L1, L2, L3	**8**

FCH4321	FORENSIC WILDLIFE AND ENTOMOLOGY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to provide advanced knowledge of the forensic wildlife and entomology. The students will understand the advanced analytical techniques to detect poaching. It will be helpful in providing knowledge of the various branches of biology and their direct applications in the criminal investigation.

Course Objective: During the course the students will be able to

- Understand the scope of wildlife forensics
- Understand and appreciate the diversity and utility of variety of animal evidences
- Elaborate concepts of entomology
- Estimate the time since death by life cycle of different insects

Course Outcomes

On completion of this course, the students will be able to

CO1. Describe entomology, time since death by insects, collection and preservation of the evidences
CO2. Explain role of insects in toxicological analysis
CO3. Explain significance of botanical evidences such as wood, leaves, pollens etc in forensic investigations
CO4. Analyse diatoms for forensic examination of drowning deaths and role of microbes in these investigations
CO5. Explain and analyse wildlife forensics, Wildlife life protection Act and significance of wildlife evidences for criminal investigations and species identification.

Course Contents	Blooms level	Number of hours
Module I: Forensic Entomology History, significance, determination of time since death- Dipterans larval development- life cycle of blowfly, housefly. Succession colonization of body, determining whether the body has been moved, body disturbance, presence and position wounds, linking suspect to the scene, collection and preservation of entomological evidence.	L1, L2	7
Module II: Entomo-toxicology Insects as toxicological indicators, Impact of drugs & toxins on insect development and Identification of drugs and toxins from the insects and larvae feeding on the body, entomology as an evidentiary tool in abuse cases.	L1, L2, L3	8

Prof. (Dr.) Anil Kumar

Manesar Gurgaon-122413

Module III: Botanical evidences Introduction, types, location, collection evaluation and forensic significance. **Wood:** Type of wood and their identification and comparison. **Leaves:** Identification of various types of leaves and their anatomy, methods of comparison. **Pollens:** Structure, function, methods of identification and comparison.	L1, L2, L3	6
Module IV: Diatoms and Microbes **Diatoms:** Nature, location, structure, extraction from various body tissues, including bone marrow, preparation of slides, methods of identification and comparison, forensic significance. **Microbes:** Types and identification of microbial organisms of forensic significance.	L1, L2, L3	7
Module V: Wildlife Forensics Introduction, importance, protected and endangered species of Animals and Plants. Identification of wildlife materials such as skin, fur, bones, nails, horn, teeth, flowers, and plants, by conventional and modern methods, Identification of Pug marks of various animals. Different methods of poaching of wildlife animals. Types of wildlife crimes. Wildlife (Protection) Act, 1972.	L1, L2, L3	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

FCH4409	GOOD LABORATORY PRACTICES SEMINAR	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	0	1
Pre-requisites/Exposure					
Co-requisites					

Course Objective:
Students will be introducing to learning the written and oral communication of technical information. Assignments include writing and presenting proposals, reports, and documentation. Emphasis on use of rhetorical analysis, computer applications, collaborative writing, and usability testing to complete technical communication tasks in the workplace.

Course outcome:
The students will able to
CO1. Explain the technical requirements for lab setup
CO2. Summarize the protocols for the lab setups and procedures.
CO3. Describe the significance of GLP in accreditations of laboratories

Course Contents:	Blooms level	Number of hours
Module I: Technical Writing Process Technical Writing: Scientific and technical subjects; formal and informal writings; formal writings/reports, handbooks, manuals, letters, memorandum, notices, agenda, minutes; common errors to be avoided.	L1, L2	
Module II: Journal Paper Writing Journal paper writing: Abstract for paper and poster, different kind of journal for forensic Sciences, impact factors of journals, ISBN number, Citation, H-index.	L1, L3	
Module III: Documentation Process Writing Skills, Selection of topic, thesis statement, developing the thesis; introductory, developmental, transitional and concluding paragraphs, linguistic unity, coherence and cohesion, descriptive, narrative, expository and argumentative writing. Analytical report, Project management in technical communication, Project writing, project proposal writing.	L1, L3

FCH4405	QUALITY MANAGEMENT AND ACCREDITATION IN FORENSIC SCIENCE LABORATORIES	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Catalog Description
This course is intended for the students who have never learned about the quality management and technical requirement in forensic laboratories. A knowledge of the process of accreditation and basic requirements for a testing and calibration laboratory to be accredited is must for the student of forensic science.

Course Objective: The objective of this course is to introduce the students with the Quality management system and requirements for the competence of testing and calibration, the technical requirements needed in a laboratory.

Course Outcomes
On completion of this course, the students will be able to
CO1. Apply the quality management in forensic laboratories.
CO2. Summarize the technical requirements for a forensic laboratory to be accredited.
CO3. Perform sampling, handling of test and calibration items, as well as assuring the quality of test and calibration results and reporting the results in forensic cases.
CO4. Setup the forensic laboratory information management system.

Course Contents:	Blooms level	Number of hours
Module I: Management requirements I General requirements for the competence of testing and calibration laboratories – Introduction, scope, management requirements: Organization, Quality system, Document control, Review of requests	L1, L2	5
Module II: Management requirements II Internal Audits; Control of records, Corrective and preventive actions, Tenders and contracts, Sub-contracting of tests and calibration, Purchasing services and supplies, Service to the clients, Complaints	L1, L2, L3	5
Module III: Technical requirements I Technical requirements: General, Personnel, Accommodation and Environmental conditions, Test and Calibration methods	L1, L2, L3	5
Module IV: Technical requirements II Equipment, measurement traceability, sampling, handling of test and calibration items, assuring the quality of test and calibration results and reporting the results	L1, L2, L3	4
Module V: Laboratory Management Laboratory information management system, Validation and safety equipments	L1, L2, L3, L4	5

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

FCH4408	FORENSIC PSYCHOLOGY	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	2	1	0	3
Pre-requisites/Exposure					
Co-requisites					

Catalog Description

This course is intended to give insight of providing the basic knowledge about the human behavior, and its impact on social environment. The students will be able to explain cognitive neuroscience and associated disorders. The course will help the students to understand the concept of intelligence and forensic psychological impact.

Course Objectives:

1. To facilitate the learning of traditional and emergent fields of cognitive neuropsychology.
2. To understand-brain-behaviour relationship in day-to-day life
3. To explore the practical implications of cognitive processes in human performance.

Course Outcomes

On completion of this course, the students will be able to

CO1. Explain the concepts of emergent fields of cognitive neuropsychology.
CO2. Describe brain-behaviour relationship in day to day life
CO3. Apply practical implications of cognitive processes in human performance.
CO4. Analyse impact of intelligence and decision making and language on personal behaviour

Course Contents:	Blooms level	Number of hours
Module-I: Cognitive Neuroscience Introduction, Philosophical antecedents, Emergence of Cognitive psychology, Approaches and key issues, Organization of Nervous system: Cognition in the Brain, Sensation to representation, Theoretical approaches to perception, Deficits in perception. Attention and consciousness	L1, L2	8
Module-II: Memory Models, Processes, Practical Applications of Cognitive Psychology in improving memory processes, Representations and manipulation of knowledge in: Images and Propositions, Spatial cognition and Cognitive map	L1, L2, L3	7
Module-III: Language Nature and Acquisition: Bilingualism and Multilingualism Reading, Bottom-up and Top-down processes, Comprehension, Neuropsychology of Language. Problem-solving and Creativity, Practical applications of cognitive psychology. Decision-making and reasoning: Deductive reasoning and inductive reasoning	L1, L2, L3, L4	9
Module-IV: Intelligence Information possessing and intelligence, alternative approaches to intelligence. Computer simulation, improving intelligence	L1, L2, L3	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

FCH4437	MAJOR PROJECT	L	T	P	C
Version 1.1	Date of Approval: Dec, 2021	0	0	0	10
Pre-requisites/Exposure					
Co-requisites					

Course outcome

On completion of this course, the students will be able to

CO1. Explain the recent techniques in the forensic field

CO2. Analyse the samples and compile the data for the research publications

CO3. Apply practical and theoretical knowledge of the Research methodology and the relevant subjects for new findings

CO4. Explain the result in the seminar/ research presentations.

GUIDELINES FOR PROJECT FILE AND PROJECT REPORT

Research experience is as close to a professional problem-solving activity as anything inthe curriculum. It provides exposure to research methodology and an opportunity to work closely with a faculty guide. It usually requires the use of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation.

Research is genuine exploration of the unknown that leads to new knowledge which often warrants publication. But whether the results of a research project are publishable, the project should be communicated in the form of a research report written by the student.

Sufficient time should be allowed for satisfactory completion of reports, considering that initial drafts should be critically analyzed by the faculty guide and corrected by the student at each stage.

PROJECT FILE

The Project File may be a very useful tool for undertaking an assignment along-with a normal semester, an exploratory study, sponsored projects, a project undertaken during summer period or any other period as per curricula where the researcher is working with a company/organization. The project/ assignment may also be a part of the bigger research agenda being pursued by a faculty/ institution/ department

The Project File is the principal means by which the work carried out will be assessed and therefore great care should be taken in its preparation. This file may be considered in continuous assessment.

In general, the File should be comprehensive and include:

- A short account of the activities that were undertaken as part of the project.
- A statement about the extent to which the project has achieved its stated objectives.
- A statement about the outcomes of the evaluation and dissemination processes engaged in as part of the project.
- Any activities planned but not yet completed as part of the project, or as a future initiative directly resulting from the project.
- Any problems that have arisen and may be useful to document for future reference.

PROJECT REPORT

The Project Report is the final research report that the student prepares on the project assigned to him. In case of sponsored project, the lay out of the project could be as prescribed by the sponsoring organization. However, in other cases the following components should be included in the project report:

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Title or Cover Page

The title page should contain Project Title; Student's Name; Programme; Year and Semester and Name of the Faculty Guide.

Acknowledgement(s)

Acknowledgment to any advisory or financial assistance received in the course of work may be given. It is incomplete without student's signature.

Abstract

A good "Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard to the objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project. It should not exceed more than 1000 words.

Table of Contents

Titles and subtitles are to correspond exactly with those in the text.

Introduction

Here a brief introduction to the problem that is central to the project and an outline of the structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided.

Materials and Methods

This section should aim at experimental designs, materials used (wherever applicable). Methodology should be mentioned in details including modifications undertaken, if any. It includes organization site(s), sample, instruments used with its validation, procedures followed and precautions.

Results and Discussion

Present results, discuss and compare these with those from other workers, etc. In writing this section, emphasis should be laid on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in textbooks. Avoid abrupt changes in contents from section to section and maintain a lucid flow throughout the thesis. An opening and closing paragraph in every chapter could be included to aid in smooth flow.

Note that in writing the various sections, all figures and tables should as far as possible be next to the associated text, in the same orientation as the main text, numbered, and given appropriate titles or captions. All major equations should also be numbered and unless it is necessary, do not write in "point" form.

While presenting the results, write at length about the various statistical tools used in the data interpretation. The result interpretation should be simple but full of data and statistical analysis. This data interpretation should be in congruence with the written objectives and the inferences should be drawn on data and not on impression. Avoid writing straight forward conclusion rather; it should lead to generalization of data on the chosen sample.

Results and its discussion should be supporting/contradicting with the previous research work in the given area. Usually, one should not use more than two researches in either case of supporting or contradicting the present case of research.

Conclusion(s) & Recommendations

A conclusion should be the final section in which the outcome of the work is mentioned briefly.

Check that your work answers the following questions:

1. Did the research project meet its aims (check back to introduction for stated aims)?
2. What are the main findings of the research?
3. Are there any recommendations?
4. Do you have any conclusion on the research process itself?

Implications for Future Research

This should bring out further prospects for the study either thrown open by the present work or with the purpose of making it more comprehensive.

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Appendices

The Appendices contain material which is of interest to the reader but not an integral part of the thesis and any problem that have arisen that may be useful to document for future reference.

References

References should include papers, books etc. referred to in the body of the report. These should be written in the alphabetical order of the author's surname. The titles of journals preferably should not be abbreviated; if they are, abbreviations must comply with an internationally recognised system.

Examples:

For research article:

Voravuthikunchai SP, Lortheeranuwat A, Ninrprom T, Popaya W, Pongpaichit S, Supawita T. (2002) Antibacterial activity of Thai medicinal plants against enterohaemorrhagic *Escherichiacoli*O157: H7. *Clin Microbiol Infect* ,**8**(suppl 1): 116–117.

For book:

Kowalski, M. (1976) Transduction of effectiveness in *Rhizobium meliloti*. SYMBIOTIC NITROGEN FIXATION PLANTS (editor P.S. Nutman IBP), **7**: 63-67

The Layout Guidelines for the Project File & Project Report:

1. A4 size Paper
2. Font: Arial (10 points) or Times New Roman (12 points)
3. Line spacing: 1.5
4. Top and bottom margins: 1 inch/ 2.5 cm; left and right margins: 1.25 inches/ 3 cm

ASSESSMENT OF THE PROJECT FILE AND THE PROJECT REPORT

Essentially, the assessment will be based on the quality of the report, the technical merit of the project and the project execution. Technical merit attempts to assess the quality and depth of the intellectual efforts put into the project. Project execution is concerned with assessing how much work has been put in.

The Project should fulfill the following ***assessment objectives:***

1. Range of Research Methods used to obtain information
2. Execution of Research
3. Data Analysis (Analyze Quantitative/ Qualitative information)
4. Quality Control
5. Conclusions

Assessment Scheme:

Continuous Evaluation:

40% (Based on punctuality, regularity of work, adherence to plan and methodology, refinements/ mid-course corrections etc. as reflected in the Project File.)

Final Evaluation:

60% (Based on the Documentation in the file, Final report layout, analysis and results, achievement of objectives, presentation/ viva)

It is recommended that the Final evaluation should be carried out by a panel of evaluators.

Syllabus - Semester First

COMPUTER FORENSICS

Course Code: FCH2151 **Credit Units: 3**

Course Objectives:

- To correctly define and cite appropriate instances for the application of computer forensics Correctly collect and analyze computer forensic evidence
- Identify the essential and up-to-date concepts, algorithms, protocols, tools, and methodology of Computer Forensics

Course Contents:

Module 1: Cyber Crime

Introduction to Digital Forensics, Definition and types of cybercrimes, electronic evidence and handling, electronic media, collection, searching and storage of electronic media, introduction to internet crimes, hacking and cracking, credit card and ATM frauds, web technology, cryptography, emerging digital crimes and modules.

Module 2: Digital Forensics

Forensics Investigation Process: Pre-search consideration, Collection of Evidences from crime scene, Acquisition, Duplication and Preservation of evidences, Examination and Analysis of evidences, Storing of Evidences, Documentation and Reporting, Maintaining the Chain of Custody. Hashing and its importance. Understanding Storage Formats for Digital Evidences – Raw Format, Proprietary Formats, Advanced Forensic Formats. Data Acquisition of live system, Shutdown Systems and Remote systems. Digital Forensics Standard Operating Procedures. Software and Hardware Tools used in Forensic Analysis – Open Source and Proprietary tools. Challenges and issues in Cyber-crime investigations and Digital forensics, Legal and privacy issues.

Module 3: Computer Forensics

Definition and Cardinal Rules, Data Acquisition and Authentication Process, Windows Forensic Analysis of File Systems-FAT12, FAT16, FAT32 and NTFS, UNIX file Systems, Mac file systems, Embedded System Analysis, Network Forensic Analysis Overview, Cloud Computing-an introduction.

Module 4: Forensic Tools and Processing of Electronic Evidence

Introduction to Forensic Tools, Usage of Slack space, tools for Disk Imaging, Data Recovery, Vulnerability Assessment Tools, Encase and FTK tools, Anti Forensics and probable counters, retrieving information, process of computer forensics and digital investigations, processing of digital evidence, digital images, damaged SIM and data recovery, multimedia evidence, retrieving deleted data: desktops, laptops and mobiles, retrieving data from slack space, renamed file, ghosting, compressed files.

COMPUTER FORENSIC PRACTICAL

List of Exercises

- Live Case Studies
- Open Source Forensic Tools
- Disk Forensics and Data Recovery
- Cryptography: Algorithm Implementation
- Anti-forensic techniques
- Steganography
- Keyloggers
- Networkmonitors
- Flowchart management
- Algorithm designs
- UML diagrams
- e-Commerce on websites

Syllabus - Semester Second

ETHICS, POLICIES AND THE IT ACT

Course Code: FCH2251 **Credit Units: 3**

Course Objectives:
To understand the ethics and laws by which cyberspace is governed in our country and worldwide.

Course Contents:

Module 1: Introduction
Basics of Law and Technology, Introduction to Indian Laws, Scope and Jurisprudence, Digital Signatures, E Commerce: Introduction, possible crime scenarios, law coverage, data interchange, mobile communication development, smart card and expert systems.

Module 2: Indian and International Laws
Indian Laws, Information Technology Act 2000, Indian Evidence Act, India Technology Amendment Act 2008, Introduction to Indian Penal Code, Computer Security Act 1987, National Information Infrastructure Protection Act 1996, Fraud Act 1997, Children Online Protection Act 1998, Computer Fraud and Abuse Act 2001. Introduction to International Laws, International Cyber Laws, Policy and Compliance, Corporate IT Policy Formulations.

Module 3: Intellectual Property Rights
Intellectual Property, IP Theft, Copyright, Trademark, Privacy and Censorship, Introduction to Cyber Ethics, rights over intellectual property, Compliance Auditing, Ethical hacking.

.

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE
Weightage (%)	10	7	8	5	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, ATTD: Attendance EE: End Semester Examination

Syllabus - Semester Third

BIOMETRIC TECHNOLOGY

Course Code: FCH2352 **Credit Units: 3**

Course Objectives:

- To understand fundamentals of biometric system and its performance metrics
- To understand the components, issues and approaches for physiological biometrics.
- To learn the technology behind behavioral biometric systems like voice scan, signature scan and gait analysis along with their challenges.
- Know the applicability and privacy concerns in biometrics.

Course Contents:

Module 1: Biometric Fundamentals

Introduction: Biometric fundamentals – Biometric technologies – Biometrics Vs traditional techniques – Characteristics of a good biometric system – Benefits of biometrics, Components and steps of a biometric system, Key biometric processes: verification, identification and biometric matching – Performance measures in biometric systems, FAR,FRR, FTE rate, EER and ATV rate, Layered biometric solutions, Types of biometrics and commonly used biometrics.

Applications of a Biometric System

Applications of Biometric Systems: industry, Government, offices, banks, defense and forensics, Security and Privacy Issues.

Module 2: Physiological Biometrics: Leading technologies : Finger-scan – Facial-scan – Iris-scan – components, working principles, competing technologies, strengths and weaknesses – Other physiological biometrics : Hand-scan, Retina-scan – components, working principles, competing technologies, strengths and weaknesses – Automated fingerprint identification systems.

Module 3: Leading Behavioral Biometrics technologies: Voice scan – Signature scan– Gait scan-components, working principles, strengths and weaknesses, challenges and scope of behavioral biometrics.

Voice Recognition: Voice scan, speaker features, short term spectral feature extraction, speaker matching, Gaussian mixture model, NIST speaker Recognition Evaluation Program.

Speech recognition: Introduction-Regular Expressions and automata-Words and transducers-N-grams Part of speech tagging-Hidden Markov and Entropy models, Speech-Phonetics-Speech synthesis-Automatic speech recognition, speech recognition versus voice recognition.

Module 4: Gait Pattern Analysis

Fundamentals of Gait Analysis, Gait Analysis: Considerations and Terminology, Motion Analysis Systems, Ground Reaction Forces, Introduction to EMG, Motion Analysis, Gait Cycle, Abnormalities in Gait, Challenges in gait recognition

Examination Scheme:

Components	CT	HA	S/V/Q	ATTD	EE
Weightage (%)	10	7	8	5	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, ATTD: Attendance
EE: End Semester Examination

Syllabus - Semester Fourth

IMPLEMENTATION PRACTICAL ON MATLAB

Course Code: FCH2451 **Credit Units: 3**

Experiments based on following concepts:

- Introduction to MATLAB
- Basic MATLAB programming (matrices, plots, multiple plots)
- Acquisition
- Noise filtering
- Image Enhancement
- Region of interest extraction
- Feature Extraction
- Classification

Examination Scheme:

Components	TA	LR	V	A	EE
Weightage (%)	10	7	8	5	70

Note: TA-Teacher's Assessment, LR-Lab Record, V-Viva

Syllabus - Semester Fifth

CYBER SECURITY

Course Code: FCH2551 **Credit Units: 3**

Course Objectives:

- Understand the threats in networks and security concepts.
- Apply authentication applications in different networks.
- Understand security services for email.
- Awareness of firewall and it applications.

Course Contents:

Module 1: Cyberspace

Ethical hacking, Attack Vectors, Cyberspace and Criminal Behaviour, Clarification of Terms, Traditional Problems associated with Computer Crimes, Computer language, Network Language, Realms of Cyber world, brief history of the internet, contaminants and destruction of data, unauthorized access, computer intrusions, white-collar crimes, viruses and malicious code, virus attacks, pornography, software piracy, mail bombs, exploitation, stalking and obscenity in internet.

Module 2: Network Forensics

Network Forensics: Networking, Overview of OSI Model and TCP/IP Protocol. IP Addressing and NAT. Types of IP addresses, Digital and Analog Signaling Methods, Network Types (LAN, MAN and WAN) and Topologies, Network Hardware devices (hubs, switches, bridges, repeaters, routers etc.) and Client/Server Computing, Routers and Routing Protocols.

Monitoring of computer network and activities, Live Packet Capturing and Analysis. Searching and collection of evidences from the network. Network Intrusion Detection and Analysis. SQL Injection, Event Log Aggregation – role of logs in forensic analysis, tools and techniques. Investigating network attacks. Evidence collection from Routers and CCTV DVRs.

Module 3: Network Security

Investigation Tools, e-discovery, EDRM Models, digital evidence collection and preservation, email investigation, email tracking, IP tracking, email recovery, search and seizure of computer systems, password cracking.

Module 4: Operating Systems

Operating System: Introduction, Objectives and Functions of Operating System. Types of Operating system- Windows, Linux, Mac, Booting process of computers.

Windows artifact analysis, Internet Artifacts, OS Artifacts, File System Artifacts, Registry Artifacts, Application Artifacts, Report Writing.

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE
Weightage (%)	10	7	8	5	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, ATTD: Attendance

CYBER SECURITY PRACTICAL

List of Exercises

- File System Analysis
- Log Analysis
- Network Devices: Modem, Router, Switch, Hub, Repeater
- SQL Injection
- Cross Site Scripting
- Click Jacking
- TCP/ IP Attacks
- Bitnet analysis
- Malware Analysis
- IR Objectives and Team Building
- Email Tracking
- IP Tracking
- Cyber psychology and Social Engineering Test Profiling

Syllabus - Semester Sixth

INCIDENT RESPONSE MANAGEMENT

Course Code: FCH2651 **Credit Units: 3**

Course Objectives:

- Defining an incident relating to cyber security.
- Recognizing an Incident
- Protocols for first on crime scene investigations.
- Government approved handling of computer crime scenarios.

Course Contents:

Module 1: Introduction

Cyber Incident Statistics, Computer Security Incident, Information as Business Asset, Data Classification, Information Warfare, Key Concepts of Information Security, Vulnerability, Threat and Attacks, Types of Computer Security Incidents, Examples of Incidents, Incidents Categorization, Low Level Incident, Mid Level Incident, High Level Incident.

Module 2: Incident Response Management

Introduction to Incident Response Process, Preparing for Incident Response, detection of an Incident, IRM life cycle-preparation, Identification, Detection, Containment, Eradication, Recovery, lessons learnt, Investigations of Cyber Crime cases as per IRM cycles, opinion formatting for cyber crime cases, court testimonies, case studies.

Module 3: Investigation of Incidents

Incident Prioritization, Incident Response and Handling process, Disaster Recovery, Technologies and Impacts, Virtualization and Impacts, Estimated Cost of an Incident, Incident Reporting Organizations, Vulnerability Reports, Incident Identification, Need and Goals of Incident Response.

Module 4: Incident Response Team

Incident Response Team development, Security Awareness and Training Checklist, Incident Management, Purpose of Incident management, Incident management process, Incident management team, Incident Response Team and Members, Member Goals and Responsibilities, Developing Skills in Incident Response Personnel, Incident Response Team Structure, Team Dependencies and Services.

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE
Weightage (%)	10	7	8	5	70

DATA ANALYTICS

Syllabus - Semester First

OPTIMIZATION TECHNIQUES

Course Code: MTH2151 **Credit Units: 03**

Course Objective:
The problems in optimization are the most common applications of mathematics. The main aim of this course is to present different methods of solving optimization problems in the areas of linear programming.

Course Contents:
Module I: Introduction to OR
Historical Development of OR, OR models and Advantages, Methodology of OR, Advantages of OR, Features of OR solution, Applications and Scope of OR

Module II: Linear Programming Problems (LPP)
Definition of LPP, General Structure of Linear Programming, Formulation of LPP, Advantages and Limitations of Linear Programming, Graphical Solutions of Linear Programming Problems. Simplex Method, Degeneracy, Duality.

Module III: Transportation Problems
Introduction to Transportation Model, Degeneracy in TP, Solution Techniques of TP, Different Methods for Obtaining Initial Basic Feasible Solutions viz. Matrix Minima Method, Row Minima Method, Column Minima Methods, Vogel's Approximation Method, Techniques for Obtaining Optimal Basic Feasible Solution – Stepping Stone and MODI Method. **Assignment Problems:** Definition, Types of Assignment Problems, Hungarian Method for AP.

Module IV: Game Theory
Concept of Game problem. Rectangular games. Pure strategy and Mixed strategy. Saddle point and its existence. Optimal strategy and value of the game. Algebraic method, Graphical method and Dominance method of solving Rectangular games. Inter-relation between the theory of Games and L.P.P

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

STATISTICS

Course Code: MTH2251 **Credit Units: 03**

Course Objective:
Statistics plays an important role in data analytics. The main aim of this course is to help the students to read, classify and then interpret the data given to them and draw conclusions.

Module I: Data and Representation
Introduction to Statistics, Collection of data, classification and tabulation of data, Types of data: Primary data, Secondary data, Presentation of data Diagrammatic and Graphical Representation: Histogram, frequency curve, frequency polygon, Ogive curves, stem and leaf chart.

Module II: Measures of Central Tendency and Dispersion
Arithmetic Mean (A.M.) Definition, Mode, Median, Partition Values : Quartiles, Deciles and Percentiles, Box Plot, Percentile ranks. Means of transformed data, Geometric Mean (G.M.) Definition, Harmonic Mean (H.M.), Weighted Mean : Weighted A.M., G.M. and H.M.
Range, Mean deviation Mean square deviation, Variance and Standard Deviation, Combined variance (derivation for 2 groups), Combined standard deviation.

Module III: Correlation and Regression
Bivariate normal distribution, types, importance, methods of measuring correlation-scatter diagram, Karl Pearson's Coefficient of Correlation and Spearman's rank Correlation. Regression lines, Difference between regression and correlation, uses of Regression.

Module IV : Sampling theory and tests of significance
Methods of sampling (Description only): Simple random sampling with and without replacement (SRSWR and SRWOR) stratified random sampling, systematic sampling.
Tests of significance – z, t, chi-square and F.

Examination Scheme:

Components	CD	CT1	SA	A	EE
Weightage	5	10	10	5	70

CD= Class Discussion, CT 1= Class Test, SA= Short Assignments, A= Attendance. EE= External Examination

Syllabus - Semester Third

DATA MINING

Course Code: MTH2351 **Credit Units: 03**

Module 1: DATA WAREHOUSING
Data warehousing Components –Building a Data warehouse –- Mapping the Data Warehouse to a Multiprocessor Architecture – DBMS Schemas for Decision Support – Data Extraction, Cleanup, and Transformation Tools –Metadata.

Module 2: BUSINESS ANALYSIS
Reporting and Query tools and Applications – Tool Categories – The Need for Applications – Cognos Impromptu – Online Analytical Processing (OLAP) – Need – Multidimensional Data Model – OLAP Guidelines – Multidimensional versus Multirelational OLAP – Categories of Tools – OLAP Tools and the Internet.

Module 3 : DATA MINING , CLUSTERING AND APPLICATIONS AND TRENDS IN DATA MINING
Introduction – Data – Types of Data – Data Mining Functionalities – Interestingness of Patterns – Classification of Data Mining Systems – Data Mining Task Primitives – Integration of a Data Mining System with a Data Warehouse – Issues –Data Preprocessing, Cluster Analysis - Types of Data – Categorization of Major Clustering Methods – Kmeans – Partitioning Methods – Hierarchical Methods - Density-Based Methods –Grid Based Methods – Model-Based Clustering Methods – Clustering High Dimensional Data - Constraint – Based Cluster Analysis – Outlier Analysis – Data Mining Applications.

Module 4 : ASSOCIATION RULE MINING AND CLASSIFICATION
Mining Frequent Patterns, Associations and Correlations – Mining Methods – Mining Various Kinds of Association Rules – Correlation Analysis – Constraint Based Association Mining – Classification and Prediction - Basic Concepts - Decision Tree Induction - Bayesian Classification – Rule Based Classification – Classification by Backpropagation – Support Vector Machines – Associative Classification – Lazy
Learners – Other Classification Methods – Prediction

DATABASE MANAGEMENT SYSTEM

Course Code: MTH2451 **Credit Units: 03**

Module-I

INTRODUCTION: Introduction; An example; Characteristics of Database approach; Actors on the screen; Workers behind the scene; Advantages of using DBMS approach; A brief history of database applications; when not to use a DBMS. Data models, schemas and instances; Three-schema architecture and data independence; Database languages and interfaces; The database system environment; Centralized and client-server architectures; Classification of Database Management systems.

Module-II

ENTITY-RELATIONSHIP MODEL: Using High-Level Conceptual Data Models for Database Design; An Example Database Application; Entity Types, Entity Sets, Attributes and Keys; Relationship types, Relationship Sets, Roles and Structural Constraints; Weak Entity Types; Refining the ER Design; ER Diagrams, Naming Conventions and Design Issues; Relationship types of degree higher than two.

Module-III

RELATIONAL MODEL AND RELATIONAL ALGEBRA: Relational Model Concepts; Relational Model Constraints and Relational Database Schemas; Update Operations, Transactions and dealing with constraint violations; Unary Relational Operations: SELECT and PROJECT; Relational Algebra Operations from Set Theory; Binary Relational Operations : JOIN and DIVISION; Additional Relational Operations; Examples of Queries in Relational Algebra; Relational Database Design Using ER- to-Relational Mapping.

Module-IV

TRANSACTION MANAGEMENT: The ACID Properties; Transactions and Schedules; Concurrent Execution of Transactions; Lock - Based Concurrency Control; Performance of locking; Transaction support in SQL; Introduction to crash recovery; 2PL, Serializability and Recoverability; Lock Management; Introduction to ARIES; The log; Other recovery-related structures; The write-ahead log protocol; Checkpointing; Recovering from a System Crash; Media Recovery; Other approaches and interaction with concurrency control.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

Syllabus - Semester Fifth

INTRODUCTION TO FINANCIAL MODELLING

Course Code: MTH2551 **Credit Units: 03**

Prerequisites: Introduction to Probability Theory

Basic notions %G–%@ Cash flow, present value of a cash flow, securities, fixed income securities, types of markets.

Forward and futures contracts, options, properties of stock option prices, trading strategies involving options, option pricing using Binomial trees, Black %G–%@ Scholes model, Black %G–%@ Scholes formula, Risk-Neutral measure, Delta %G–%@ hedging, options on stock indices, currency options.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; Att: Attendance

STATISTICAL QUALITY CONTROL

Course Code: MTH2651 **Credit Units: 03**

Total quality control in an industry. Quality planning, quality conformance, quality ad-herence. Quality assurance and quality management functions.

Control charts and allied techniques. Concept of quality and meaning of control. Concept of inevitability of variation-chance and assign-able causes. Pattern of variation. Principles of rational sub-grouping.

Different types of control charts. Concept of process capability and its comparison with design specifications, CUSUM charts.

Acceptance sampling. Sampling inspection versus 100 percent inspection. Basic concepts of attributes and variables inspection. OC curve, Single, double, multiple and sequential sampling plans, Management and organisation of quality control.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

MATERIALS SCIENCE & TECHNOLOGY

Syllabus - Semester First

FUNDAMENTALS OF MATERIALS SCIENCE

Course Code: PHY2151 **Credit Units: 03**

Course Objective:
The objective of this course is to introduce the students with the basics of the materials science and physical phenomenon.

Course Contents:

Module-I: Basics of Crystal Structure
Space lattice and unit cells, Crystal system, Symmetry operation, Structures of common metallic and ceramic materials, Packing fraction, coordination number, Crystallographic points, directions and planes, Linear and planar densities, Structure determination using X-ray diffraction and Braggs law, single crystal and polycrystalline materials, non-crystalline materials and glass transition temperature,

Module-II: Bonding in Solids and Imperfections
Forces between Atoms: Mechanism of Bond Formation and Bond Energy, Primary bonding in solids viz. ionic, covalent and metallic bonds, Secondary bonding, Perfect and imperfect crystal, Point defects in metals and ceramics, Frenkel and Schottky defects, Color centres, Dislocations: edge and screw dislocation, Interfacial defects, Volume defects,

Module-III: Diffusion and Alloy Systems
Diffusion and its types, Diffusion mechanisms, Diffusion Coefficient: Fick's Laws of Diffusion, Factors affecting diffusion, Applications of diffusion, Alloy systems, Solid solutions: Substitutional and Interstitial, The families of engineering alloys, Hume-Rothery's Rules, Intermediate solid solutions.

Module-IV: Phase diagrams and phase transformation
Phase, Phase equilibrium, Phase rule, Unary and binary phase diagrams, Interpretation of phase diagrams, Phase diagrams of some important metals and ceramics, microstructure changes during cooling, lever rule, invariant reactions, iron-iron carbide phase diagram. Phase transformation, Nucleation and growth of phases, Introduction to TTT curves, heat treatment processes

Examination Scheme:

Syllabus - Semester Second

CLASSIFICATION & SELECTION OF MATERIALS

Course Code: PHY2251 **Credit Units: 03**

Course Objective:
The objective of the course is to introduce and familiarize the students with the different classes of engineering and advanced materials to the students.

Course Contents:

Module-I: Metals and Alloys
Metals, Alloys (ferrous and non-ferrous), types of steel, cast iron, High temperature steels, properties and applications.
Aluminum and its alloys- physical, chemical and mechanical properties, magnesium, titanium alloys - microstructural features, properties and applications.
Copper and its alloys: classification, physical, chemical and mechanical properties; lead, tin, zinc, silver, gold alloys - microstructural features - properties and applications.

Module-II: Ceramics and glasses
Ceramics: bonding, crystal structure and defects; structure of silicates; polymorphic transformations.
Non crystalline materials - structure, requirement for glass formation, Zachariasen rules, viscosity based transition points, devitrification; glass forming methods; Unary; binary and ternary systems.

Module-III: Composites and Polymers
Composites: Introduction, classification, bonding and failure criteria. Reinforcing materials, different processing methods, novel applications.
Polymers: Introduction, comparison with metals and ceramics - classification, Polymerization, molecular weight determination, Properties, processing and applications.

Module-IV: Advanced materials
Biomaterials: Introduction, need for biomaterials; Property requirements; Metallic, ceramic and polymeric implants, composites as biomaterials; applications.
Superalloys, Iron, nickel and cobalt based superalloys, Shape memory alloys, low temperature materials.
Nano materials – Concept, scale /dimensional aspects, materials and coatings for wear resistance.

Examination Scheme:

PROPERTIES OF MATERIALS

Course Code: PHY2351 **Credit Units: 03**

Course Objective:
The objective of the course is to study the properties of the materials to be used in the different applications and to introduce the students to the basics of the structure property correlation in the materials

Course Contents:

Module-I: Mechanical behavior
Concept of stress and strain, tensile strength, compressive strength, yield point phenomenon, Elastic behavior of materials,elastic modulus, Anelastic and Viscoelastic behaviour, strengthening mechanism, work hardening, solid solution hardening, precipitation hardening,hardness, Failure mechanisms: fracture, creep and fatigue.

Module-II: Electrical and dielectric properties
Electricity conductivity, density of states, Fermi energy, Band theory of solids, metals, Semiconductors, Insulators, Semiconductors: Intrinsic and Extrinsic semiconductors, Factors affecting carrier mobility, hall-effect, carrier concentration of semiconductors
Dielectric Behavior: Capacitance, Types of Polarization, Frequency Dependence of the Dielectric Constant, Dielectric Strength, Ferroelectricity, Piezoelectricity, pyro-electricity Applications

Module-III: Magnetic and Optical properties
Introduction, Dia, Para Ferro, Antiferro and Ferrimagnetic materials. Effect of temperature on magnetic behavior, Domains and hysteresis, Soft and Hard magnetic materials. Application.
Optical properties: Light Interactions with Solids, Atomic and Electronic, Interactions, Optical properties of nonmetals, Opacity and translucency in insulators, Luminescence, LEDs, lasers, Light propagation in optical fibers

Module-IV: Thermal Properties and corrosion resistance
Introduction, Heat capacity, thermal expansion, Materials of Importance: Invarand Other Low-Expansion Alloys, Thermal Conductivity, Thermal Stresses
Introduction, Corrosion rates, Passivity, Environmental effects, Cause and Types of corrosion, Corrosion of ceramics and polymers, Corrosion Prevention.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Exam; A: attendance

Syllabus - Semester Fourth

MANUFACTURING PROCESSES FOR MATERIALS

Course Code: PHY2451 **Credit Units: 03**

Course Objective:
The different industrial processes used for the fabrication and preparation of the materials is introduced in this course.

Course Contents:

Module-I: Introduction to manufacturing processes
different approaches – technical and economic considerations – significance of material properties with respect to selection of manufacturing process

Module-II: Processing techniques
Conventional casting processes – advantages and limitations – melting practices – design of castings – special casting processes
Powder processing: pre-consolidation-shape forming processes; Fundamental Sintering mechanisms, various advanced sintering techniques.

Module-III: Fabrication of materials
Fabrication of materials by Rolling; forging; extrusion; drawing - sheet metal forming. Classification of rolling, extrusion, drawing, advantages and limitations of different fabrication processes.

Module-IV: Conventional material joining processes
Conventional material joining processes – concept of weldability – need for dissimilar joints- machining processes – concept of machinability – material examples – developments in machining processes

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Exam; A: Attendance

Syllabus - Semester Fifth

MATERIALS TESTING & CHARACTERIZATION

Course Code: PHY2551 **Credit Units: 03**

Course Objective:
The objective of the course is to introduce different materials testing and characterization techniques to the students.

Course Contents:

Module-I: Introduction and Spectroscopic methods
Introduction: Comparison of major techniques, Advantages and disadvantages; Spectroscopic methods: Atomic absorption spectrometry, Atomic fluorescence spectrometry, UV-Visible spectroscopy; Raman spectroscopy, Fourier transform infrared spectroscopy, XPS, UPS, Auger electron spectroscopy.

Module-II: X-ray techniques and Optical Microscopy
X-ray techniques: XRD, X-ray fluorescence spectroscopy, Wavelength dispersive spectroscopy (WDS);Energy dispersive spectroscopy (EDS),
Optical Microscopy: Image formation, Resolution, Aberrations, Imaging modes, Specimen preparation, Confocal microscopy

Module-III: Electron microscopy and Thermal analysis
Electron microscopy: Scanning electron microscopy; Transmission electron microscopy, Electron diffraction, Scanning tunneling microscope, Atomic force microscope
Thermal analysis: Thermo gravimetric analysis, Differential thermal analysis, Differential scanning calorimetry, Dynamic mechanical analysis, Thermo-mechanical analysis

Module-IV: Electrical, magnetic and non-destructive testing
Electrical and magnetic properties: Two probe and four probe methods for electrical characterization, Vibratingsample magnetometer (VSM),
Non-destructive testing:Radiography, Ultrasonic, Acoustic emission, Thermography, Holography, Basic principles, Applications in airframe and rock.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Exam; A: Attendance.

MATERIALS AT NANOSCALE

Course Code: PHY2651 **Credit Units: 03**

Course Objective:
The main objective of the course is familiarize the students to the exciting area of the nanotechnology and preparation, characterization of change in the materials properties at the nanoscale.

Course Contents:
Module-I: Introduction to Nano world:
Introduction to Nanostructures: Carbon Nanotubes (CNT), Graphenes, Fullerenes, Nano Peapods, Quantum Dots and Semiconductor Nanoparticles Metal-based Nanostructures (Iron Oxide Nanoparticles) Nanowires, Polymer based nanostructures including dendrimers, Introduction to metal based nanostructures, Protein-based Nanostructures: Nanomotors etc.

Module-II: Structure, properties and Bonding in Nanomaterials:
Chemical Bonds (types and strength)Intermolecular Forces Molecular and Crystalline Structures, Hierarchical Structures, Bulk to Surface transition, surface reconstruction, Mechanical, Electronic, Optical, Magnetic and Thermal properties.

Module-III: Synthesis & Methods of preparation of nanomaterials:
Bottom -up Synthesis, Top-down Approach: Precipitation, Mechanical Milling, Colloidal routes, Self-assembly, Vapour phase deposition, MOCVD Sputtering, Evaporation, Bio-inspired synthesis, Nanocomposite fabrication, Nanolithography, Molecular Beam Epitaxy, Atomic Layer Epitaxy, MOMBE etc.

Module-IV: Applications
Nano-electronics, Nano optics, Nanoscale chemical-and bio-sensing Biological/biomedical applications, Photovoltaic, fuel cells, batteries and energy-related applications, High strength nanocomposites, Nanoenergetic materials

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE

PHARMACEUTICALS

Syllabus - Semester First

COSMETIC FORMULATION

Course Code: CHY2152 **Credit Units: 03**

Course Objective:
This course is intended to provide a comprehensive survey of ingredients fundamental to the cosmetic industry. The course will emphasize current trends in the selection of cosmetic ingredients. The chemistry and technology of cosmetic raw materials will be related to their behavioral properties as utilized in the construction of stable functional systems. In this way, it is intended to generate a better understanding of the contributions of ingredients to the performance of finished product formulations. Emphasis will be placed on recognizing and dealing with problem areas associated with the use of various ingredients. Safety considerations and other pertinent matters which can influence ingredient selection will be included in these discussions.

Course Content:
Module I:
Classification of raw materials and raw materials used in the cosmetic industry for the manufacture of finished products. Method of sampling, Indian Standard specification laid down for sampling and testing of various cosmetics in finished form by the bureau of Indian standards. Factors affecting stability of a formulation, ICH guidelines, Methods of stabilizations and Methods of stability testing.Concept of development of stability indicating analytical methods.

Module II:
Determination of Physical and chemical constants such as extractive values, moisture content, alcohol content, volatile oil content, ash values, bitterness values, foreign matters, and physical constants applicable to the lipid containing drugs. Microbial counts, bioburden and Pharmacopoeial microbial assays.

Module III:
Brief introduction of the following cosmetic preparation and a detailed study on their quality control: Shampoo, Tooth paste, skin powder, skin creams, hair creams, nail polish, after shave lotion, bath and toiletries, lipstick and hair dyes, perfumes, depilatories.

Module IV:
Packaging of cosmetics –Filling of solids, semisolids & liquids. Materials used for cosmetic packaging Rules & regulations and legal provisions for packaging & labeling.

Syllabus - Semester Second

INDUSTRIAL MANAGEMENT AND SAFETY PROCESSES

Course Code: CHY2252 **Credit Units: 03**

Course Objective:
The curriculum is developed to help the students understand the basic functions & responsibilities of a manager, provide him tools and techniques of managing different activities of the business concerned and to understand & interpret the provisions of some of the important provisions related to patent, trademark etc. It also aims at minimizing the chances of risks, injuries and accidents by implementing risk management techniques and safety management operations, monitoring the operating systems and bolstering the safety measures of an industry in general. With the rise of natural disasters in and around our world, the importance of the safety of human capital, protection of the environment and conservation of existing assets of an industry is increasing, leading to growing relevance of these skills.

Course Contents:
Module I:
Basic Concepts of Management Function of Management
Planning, Organizing, Directing, Control, Decision-making, Budgeting, Inventory Management (IM) & Quality Control (QC), Meaning & Importance of Inventory management, Inventory models, Cost consideration, Economic order quantity model.
Quality Management
Meaning & definition of Quality-Quality control systems-quality assurance-planning for quality- total quality management (TQM) philosophy-implementation of TQM in service and manufacturing industries-national & international standards.

Module II:
Manufacturing Management
Production planning & control, dynamics of material flow-inventory-bottlenecks and process variability, planning levels and time scales, forecasting-aggregate planning, synchronized manufacturing and theory of constraints-just in time production-shop floor performance monitoring.

Module III:
Safety in Chemical Process Industries
Safety in industries; need for development; importance safety consciousness in Indian chemical industry; safety programmes, elements of safety programme; effective realization, economic and social benefits.Industrial safety- Chemical process industries; potential hazard; chemical and physical job safety analysis; high presssure; high temperature operation; dangerous and toxic chemicals; highly radioactive materials; safe handling and operation of materials and machineries; planning and layout.

Examination Scheme:

Syllabus - Semester Third

DRUG DESIGN

Course Code: CHY2352 **Credit Units: 03**

Course Objective

The Principles of Drug Design course aims to provide students with an understanding of the process of drug discovery and development from the identification of novel drug targets to the introduction of new drugs into clinical practice. It covers the basic principles of how new drugs are discovered with emphasis on lead identification, lead optimization, classification and kinetics of molecules targeting enzymes and receptors, prodrug design and applications, as well as structure-based drug design methods. Recent advances in the use of computational and combinatorial chemistry in drug design will also be presented. The course is further enhanced with invited lectures on recent developments and applications of drug design principles in the pharmaceutical industry.

Course Content:

Module I:

Introduction- Definition of drug (WHO), classification of drugs, nomenclature of drugs, stereochemical aspects of drugs, definitions of terms commonly used in the chemistry of drugs, routes of drug administration and different dosage forms and applications. Introduction to phase trials in drug development.

Module II:

Structure Activity Relationships in drug design-Structure based drug design, ligand based drug design. Some case studies e.g. development of ciprofloxacin, antidiabetics and recent cephalosporins. Target selection and lead identification, Natural product sources, Fermentation / Microbial sources, Synthetic, Introduction to Pharmacogenomics. Methods of conformational search used in pharmacophore mapping; catalyst/, etc. with practical examples, ADME databases.

Module III:

Molecular Modeling- Energy minimization, geometry optimization, conformational analysis, Approaches and problems; Bioactive vs. global minimum conformations; Mechanism based Drug Design including Quantum Mechanics Automated methods of conformational search; Molecular graphics.

Module IV:

QSAR-Electronic effects; Hammett equation, Lipophilicity effects; Hansch equation, Steric Effects; Taft Equation; Experimental and theoretical approaches for the determination of physico-chemical parameters, parameter inter-dependence; Case studies; Regression analysis, extrapolation versus interpolation, linearity versus non-linearity; Free Wilson Analysis; The importance of biological data in the correct form; 2D – QSAR; 3D-QSAR-examples CoMFA and CoMSIA.

Module V:

Molecular docking and dynamics-Rigid docking, flexible docking, manual docking; Advantages and disadvantages of flex-X, flex-S, autodock and dock softwares with successful examples; Monte Carlo simulations and molecular dynamics in performing conformational search, docking etc.De novo drug design techniques.

APPLICATION OF NANOTECHNOLOGY IN MEDICINE

Course Code: CHY2452 **Credit Units: 03**

Course Objective:
This course will focus on developing students' understanding of the fundamental properties, as well as synthesis and characterization of nanomaterials, coupled with their applications in nanomedicine. This course also provides a realistic approach and covers the basic concepts of chemistry, physics and biology in the behavior of molecules and molecular interaction. It also includes various experimental techniques used to characterize bio-nano systems, the nano scientific principle involved in the processing, fabrication and manipulation of nanostructures and nanoparticles.

Course Content:
Module I:
Introduction to nanomedicine-Overview of nanotechnology from medical perceptive, different types of nanobiomaterials and their biomedical applications, and cell nanostructure interactions, Synthesis, characterization, and properties of smart nanomaterials, Surface modification/bio functionalization of nanomaterials

Module II:
Nanocarriers (e.g. liposomes, polymer capsules, polymer nanoparticles, porous materials, nanogels, dendrimers, microemulsions, inorganic nanoparticles, carbon nanotubes, lipoproteins, solid lipid nanoparticles) for drug delivery applications, Stimuli-responsive smart nanomaterials, Nanomaterials in different imaging (e.g.fluorescence and MRI) applications

Module III:
BioMEMS, Lab-on-a-Chip, nano/microfluidics, biosensors, Regenerative medicine, including tissue engineering, cell and gene therapy, DNA-based nanostructures, Cellular nanomachines, Toxicology of nanomaterials

Examination Scheme:

Components	CT	HA	S/V/Q	ATTD	EE

Syllabus - Semester Fifth

INTELLECTUAL PROPERTY RIGHTS AND QUALITY ASSURANCE

Course Code: CHY2552 **Credit Units: 03**

Course Objective:
This course will focus on intellectual property rights and patenting & Indian patent law for pharmaceutical industry.

Course Content:
Module I:
Requirements of GMP, cGMP, GLP, USFDA, WHO Guidelines and ISO 9000 Series, Drugs and Cosmetics Acts and rules, Drug Regulatory Affairs, Documentation- Protocols, Forms and Maintenance of records in Pharmaceutical industry, Preparation of documents for New Drug Approval and Export Registration, Processing and its application, Intellectual Property Rights (Patent, Copyright and Trademarks), Standard Operating Procedure (SOP) for different dosage forms.

Module II:
Concepts in Validation, Validation of manufacturing, Analytical and Process Validation and its Application, Basic concepts of Quality Control and Quality Assurance Systems, Source and Control of Quality Variation of Raw Materials: Containers, Closures, Personnel, Environmental, Etc., In-process quality tests, IPQC problems in Pharmaceutical industries. ICH Guidelines, Sampling Plans, Sampling and Characteristic Curves, Master Formula generation and Maintenance.

Module III:
Patenting, Indian patent law and pharmaceutical industry
Introduction of (IPR) Intellectual Property Rights, Patents, Design, Trademarks, Copyrights, Geographical Indications etc
Patent System: Definition of Patent, Criteria for obtaining patent (Novel, Non-obvious Applications) Filing and Processing of Patents: General procedure for securing patents in India. Case studies Opposition to Grant of Patent, Patent infringement: Silent features of Indian Patents Act 1970 with latest amendments with special reference to- Product & Process Patents, Provision of compulsory license, Exclusive Marketing Right, The Term of Patent, Patent offices in India; International convention relating to Intellectual Property - Establishment of WIPO - Mission and Activities -History - General Agreement on Trade and Tariff (GATT).
Case Studies on - Patents (Basmati rice, turmeric, neem, etc.) - Copyright and related rights - Trade Marks.

PHARMACEUTICAL & COSMETICS SCIENCES LAB

Course Code: CHY2652 **Credit Units: 03**

List of Experiments (Any 15 Experiments are to be performed)

Polymers

- Caprolactum from cyclcohexanone
- Synthesis of Nylon-6,10
- Preparation of Polystyrene.
- Study the morphology of polymers through optical microscopy.
- Preparation of Epoxy resin using Bisphenol-A and Epichlorohydrin.
- Determination of molecular weight of high polymer using viscosity method.
- Determination of melt flow index of polymers and Compare their Melt Flow Characteristics

Dyes

- Preparation of Methyl Orange- An azodye.
- Preparation of Indigo

Food Industry

- Separation of artificial colorants in confectionary using TLC.
- Determination of protein content of wheat flour.

Cosmetic Products

- Shampoo
- Detergent
- Talc
- Lipstick
- Perfumes

Drugs Analysis

- Preparation of Paracetamol and Aspirin
- Analysis of Drugs:
    - Novalgin
    - Sulfa-drugs
    - Paracetamol

POLYMER TECHNOLOGY

OBJECTIVES OF PROGRAM

The term polymer refers to two different classes of materials – Plastic and Rubber. Polymer engineering uses the theory and knowledge of chemistry in order to handle production and use of polymers. The primary aim of this program is to train students to fulfill the constantly growing requirements of the polymer- based industry. The course provides an in-depth understanding of traditional commodities, such as plastics and specialty polymers, which have wide applications in the biomedical research and pharmaceutical fields. In India, the demand for polymer engineers has increased. After successful completion of the course, one can take up a career in sectors such as automotive, aerospace, packaging, power transmission, and other related manufacturing sectors. Industries based on manufacturing, processing and design of generic polymer (plastics, rubber, composites) also employ such students.

POLYMER TECHNOLOGY

Syllabus - Semester First

POLYMERIZATION

Course Code: PTE2151 **Credit Units: 03**

Course Objective:
This course provide principles, mechanism and techniques of polymerization. They will also learn about kinetic of polymerization and copolymerization.

Course Contents:

Module-I: General Characteristics of Chain Growth Polymerization, Alkene Polymerization by Free radical, anionic and cationic initiators. Kinetics of Vinyl radical polymerization

Module-II: General Characteristics of Step Growth Polymerization. Chemistry of Step Growth. Polymerization, Kinetics and Statistics of Linear Stepwise Polymerization, Absolute reaction rates.

Module-III: Chemistry of Non-radical chain Polymerization, Anionic and Cationic Polymerization Co-ordination Polymerization, Ring Opening Polymerization

Module-IV: Copolymers, Types of copolymers,copolymerization, Kinetics of Copolymerization, Block and Graft Copolymerization, Cyclopolymerization.

Module-V: Polymerizations in homogenous &heterogenous systems, Diene and divinyl Polymerization Bulk, suspension, solution and emulsion polymerization

Examination Scheme:

	IA				EE	
Components	**CT**	**Assignment**	**LR**	**Attendance**	**Theory**	**Practical**
Weightage (%)	10	5	10	5	40	30

Note: IA –Internal Assessment, EE- External Exam, CT- Class Test, LR – Lab Record.

Suggested Readings:

- Textbook of Polymer Science, F. W. Billmeyer, John Wiley & Sons
- Polymer Science & Technology, J. R. Fried, Prentice Hall
- Polymer Science, V. R. Gowariker, New Age International
- Polymer Science & Technology, P. Ghosh, Tata McGrawHill
- Principles of Polymerization, Odian, Wiley India

Syllabus - Semester Second

WASTE PLASTIC RECYCLING

Course Code: PTE2251 **Credit Units: 03**

Course Objective:
This course is beneficial to deal with different types of plastics waste, identification of plastics, segregation of plastic wastes, different types of recycling techniques, recycling of commingled plastic waste as well as various rules and regulation regarding plastic manufacturing, disposal and recycling.

Course Contents:

Module I: Introduction, Thermoplastics & thermo sets, Terminology used in recycling, coding & labeling of plastic products for sorting and identification.

Module-II: Organizations involved in plastic recycling. Types of recycling- Primary recycling, secondary recycling, tertiary recycling and quaternary recycling, recycling of mixed waste, recycling of nonwoven sacks

Module-III: Residential recycling: collection containers, education and production, recovery of resins, collection vehicles, role of material recovery facilities (MRF), role of MRF.

Module-IV: Plastic separation, working MRF,case studies, collection and separation systems.

Module-V: Recycling of PET, polyelelfines, polystyrene, Polyvinyl chloride, Engineering Thermoplastics, Acrylics, Thermo sets.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; Att: Attendance

Suggested Readings:

- Plastics Recycling; Ehrig, Hanser.
- Rubber Recycling: De, IsayevKhait, CRC Press.
- Feedstock Recycling & Pyrolysis of waste plastics, Scheirs&Kaminskey,, Wiley Interscience,
- Handbook of Plastic Technology, Vol, 2, Allen &Beker, CBS Publishers.
- Plastic Fabrication & Recycling, Chanda& Roy, CRC Press,

Syllabus - Semester Third

POLYMER TECHNOLOGY

Course Code: PTE2351 **Credit Units: 03**

Course Objective:
In this course students will learn about preparation, properties and applications of different types of plastics, especially thermoplastics and thermosetting plastics.

Course Contents:

Module-I: Preparation, properties and applications ofPolyolefins- Polyethylene, Polypropylene, Polyisobutylene, Vinyl Polymers: Polystyrene, Polyvinylchloride, Polyvinylacetate, Poly(methylmethacrylate), Polyacrylonitrile, Poly(acrylic acid)

Module-II: Preparation, properties and applications ofDiene Polymers- Polybutadiene, Styrene-Butadiene Rubber, Nitrile Rubber, Polyisoprene, Polychloroprene.

Module-III: Preparation, properties and applications ofPolyesters -Poly(ethylene terephthalate), Polycarbonates, Polyester resins.

Module-IV: Preparation, properties and applications ofPolyamides- Nylons, Polyimides, Polyurethanes, Raw Materials, PU elastomers, PU Foams, PU coatings, adhesives and sealants.

Module-V: Preparation, properties and applications ofEpoxy Polymers - Types of epoxies, Taffy Process, Hardness,Phenolics - Novolacs& Resoles.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; Att: Attendance

Readings:

- Polymer Synthesis: Theory & Practice, Braun, Springer International
- An Introduction to Plastics, Elias, Wiley Interscience
- Principles of Polymerization, G. Odion, Wiley Interscience
- Synthetic Polymers, Feldman &Barbalate, Chapman & Hall
- Synthesis of Polymers, D. Schluter, Wiley VCH

Syllabus - Semester Fourth

RUBBER & TYRE TECHNOLOGY

Course Code: PTE2451 **Credit Units: 03**

Course Objective:
At the end of the course students should be able to understand different types of rubbers, different additives used in rubber industries, compounding of rubber, manufacturing of tyres and design of tyres

Course Contents:

Module-I: Rubber Technology: Introduction, natural and synthetic rubbers, filler systems, stabilizer systems, vulcanization system, compounding ingredients, environmental requirements in 4 compounding.

Module-II: Manufacture of nitrilerubber ,chleroprene rubber, diene rubber, SBR rubbers.

Module-III: Tyre Technology- Introduction, development of tyres, classification and types of tyres, tyre components, pneumatic tyres**.**

Module-IV: Tyre& tread design, tread pattern, carcass design, bead design, Unit V: Tyre testing techniques, tubeless tyres, colouredtyres.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; Att: Attendance

Suggested Readings:

- Handbook of Plastics Testing & Failure Analysis, Vishu Shah, Wiley Interscience
- Polymer Testing & Evaluation of Plastics, Mathur&Bhardwaj, Allied Publishers
- Encyclopedia of Polymer Science & Technology, Herman F. Mark, Wiley Interscience
- Fatigue, Testing & Analysis, Lee, Elsevier
- Introduction to Plastics & Composites, E. Miller, Marcel Dekker

Syllabus - Semester Fifth

POLYMERIC NANO COMPOSITES

Course Code: PTE2551 **Credit Units: 03**

Course Objective:
This module deals with introduction, classification, preparation, properties, characterization and applications of polymer nanocomposites.

Course Contents:

Module-I: PREPARATION OF SYNTHESIS: Polymer Nanocomposites, Nanocomposites Preparation and Synthesis, Polymer Matrices: Thermoplastics, Thermosets, Elastomers, Natural and Biodegradable Polymers

Module-II: RHEOLOGY OF NANOCOMPOSITES : Rheology of Multiphase Systems, Rheology of Polymer / clay nanocomposite, Recent studies on Rheology, Measure Techniques, Steady shear Rheology, Dynamic Rheology, Non Linear Viscoelastic properties, Extensional Rheology, Rheological modeling of Nanocomposites.

Module-III: PROCESSING OF NANOCOMPOSITES : Extrusion, Injection Moulding, Blow Moulding, Foaming, Rotational Moulding

Module-IV: STRUCTURE AND PROPERTIES CHARACTERIZATION: Scattering Techniques, Microscopic Techniques, Spectroscopic Techniques, Spectroscopic Techniques, Chromatography, Solid-state characterization: Mechanical Testing, Thermal Characterization

Module-V: APPLICATION OF POLYMER NANOCOMPOSITES: Different applications of Thermoplastics, Thermosets, Biodegradable Polymersnanocomposites.

Examination Scheme:

	IA				EE	
Components	**CT**	**Assignment**	**LR**	**Attendance**	**Theory**	**Practical**
Weightage (%)	10	5	10	5	40	30

Note: IA –Internal Assessment, EE- External Exam, CT- Class Test, LR – Lab Record.

Suggested Readings:

- Luigi Nicolis& Gianfranco Carotenuto "Metal -Polymers Nanocompsites" A John Wiley & Sons, Inc Publication 2005
- Y.C. Ke& P. Stroeve" Polymer-Layered Silicate and Silica Nanocomposites- Elsevier, 2005 3. L.A. Utracki" Clay-Containing Polymeric Nanocomposites" Rapra Technology Limited, 2004

Syllabus - Semester Sixth

BIO-MEDICAL PLASTICS

Course Code: PTE2651 **Credit Units: 03**

Course Objective:
In this module student will learn about introduction, properties, processing and applications of different polymeric materials used in biomedical and tissue engineering.

Course Contents:

Module-I:
Synthetic and Natural biomaterials used in Biomedical applications
i) Polyolefin's, Polyamides, Acrylic Polymers, Fluorocarbons, Polyesters, Engg. Plastics.
ii) Collagen, Polysaccharides, Proteins etc.

Module-II:
Human applications of Plastics : Cardiovascular iMTPLants, Dental IMTPLants, Role ofplastics in Ophthalmology, Hydro gels, Drug Delivery Systems, Sutures, Burn Dressings andArtificial Skin. Hernia Mesh, adhesives and Sealants, Artificial organs and devices, Blood bags,Condoms etc.

Module-III:
Blood – polymer interactions and blood compatibility, Chemical and biochemical degradation of polymers, Tissue engineering and polymers.

Module-IV:
Testing and evaluation: in-vitro-/vivo; Standards in product development and regulations; Ethical and sociological issues.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; Att: Attendance

Suggested Readings:

- Buddy D. Ratner, Allan S. Hoffman, Fredrick J.Schoen and Jack E. Lemons (eds),"Biomaterials Science – An Introduction to Materials in Medicine", Academic Press, SanDiego (1996).
- Joon B. Park and Roderic S. Lakes, "Biomaterials : An Introduction". 2 edition, Plenum Press, New York (1992).

Bachelor of Science (Honors/ Honors with Research) in Earth Sciences

Overview

A Bachelor of Science (B.Sc.) in Earth Science is an undergraduate degree program focused on the study of the Earth, including its structure, composition, processes, and history. It encompasses various scientific disciplines such as Geology, Physics, Chemistry, Biology, Petrology, Mineralogy, Soil Science, Geology, Atmospheric Science, meteorology, oceanography, and environmental & Society etc. The program typically takes three to four years to complete and combines theoretical knowledge with practical skills.

PROGRAMME OUTCOMES

The under-graduates will be able to

PO 1. **Fundamental Knowledge**: Demonstrate comprehensive knowledge of the disciplines that form a part of a graduate programme. Execute strong theoretical and practical understanding generated from the specific graduate programme in the area of work.

PO 2. **Effective Communication:** Speak, read, write and listen clearly in person and through electronic media in English and in one Indian language, and make meaning of the world by connecting people, ideas, books, media and technology.

PO 3. **Social Competence:** Display the understanding, behavioural skills needed for successful social adaptation, work in groups, exhibits thoughts and ideas effectively in writing and orally.

PO 4. **Practical and Research Skills**: Develop the working knowledge and applications of instrumentation and laboratory techniques. Able to apply skills to design and conduct independent experiments, interpret, establish hypothesis and inquisitiveness towards research.

PO 5. **Ethics:** Recognize different value systems including your own, understand the moral dimensions of your decisions and accept responsibility for them.

PO 6. **Environment and Sustainability:** Understand the issues of environmental contexts and sustainable development.

PO 7. **Self-directed and Life-long Learning:** Acquire the ability to engage in independent and life-long learning in the broadest context socio-technological changes.

PROGRAMME SPECIFIC OUTCOMES

PSO1. Identify, define, interpret and analyze the processes linked with geology and earth sciences and the consequent products by applying knowledge of biology and mathematics. Demonstrate the knowledge of geologic time and earth's history; dynamics of crustal materials with respect to Plate Tectonics theory, outline of regional geology of India

PSO2. Conceptualize and understand the fundamentals of crystals and minerals and apply them in understanding, analyzing the principles and process involved in the origin of different type of rocks, especially those which are economically important.

PSO3. Analyze, comprehend and apply the concepts of earth sciences through field and independent project-based study. Apply the fundamentals concepts of all branches of earth sciences in solving problems related to different fields such as engineering and exploration geology, remote sensing & GIS, hazard assessment and atmospheric and marine sciences.

PSO4. Implement the theoretical concepts to the laboratory experiments. Identify and apply relevant methodologies and tools relating to earth sciences and their applications. Interpret and write effective technical literature and to function efficiently, professionally and ethically in multidisciplinary teams with an ability to engage in life-long learning**.**

Bachelor of Science (Honors/ Honors with Research) in Earth Sciences
SEMESTER-I

DESC2151	EARTH SYSTEM SCIENCES	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue
The purpose of the course is to develop a holistic understanding of the earth as a system. It attempts to illustrate the reasons for why things happen in nature the way they happen and how much humans have adapted and influenced the natural processes. It will give holistic understanding of linkages in system with a perspective of space and time in earth system.

Course Objectives
The objective of this course is to

- Grasp the fundamentals of Earth's four main systems (atmosphere, hydrosphere, biosphere, and geosphere) and their interdependencies.
- To gain Ability to explain how these systems interact to influence Earth's environment and processes.
- Examine the causes and effects of climate change and miscellaneous.
- Ability to critically evaluate human-environment interactions and propose strategies for mitigating negative impacts. Assess the impact of human activities on natural systems and explore sustainable solutions.

Course Outcomes
On completion of this course, the students will be able to
CO1. Understand the concept and origin of Earth System Sciences.
CO2. Understand the fundamentals in applying scientific techniques to explore and understand Earth's dynamic processes.
CO3. Develop a deep understanding of various geological processes, such as plate tectonics, weathering, and erosion, formation, alteration, and recycling of rocks within the Earth's crust.
CO4. Understand the Causes and Impacts of Natural Disasters to analyze the geological and atmospheric processes and develop the knowledge to evaluate their impacts and explore strategies for risk mitigation and disaster preparedness.

Course Content

Modules	Bloom's level*	Number of hours
Module I: The Universe: Concepts and origin; The Solar System and origin of planets; Terrestrial and Jovian planets; Meteorites and Asteroids; Earth in the Solar system: Origin, Size, Shape, Mass, Density, Rotational and Revolution Parameters; Age and history of the earth's surface and Geological time scale; Origin of atmosphere and composition.	**L1, L2, L3**	**20**
Module II:	**L1, L5, L6**	**22**

DESC2101	EARTH SURFACE FEATURES & PROCESSES	L	T	P	C
Version 1.1	Date of Approval:	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The objective of the course is to make the students acquainted with the various processes operating on the earth and how the interactions leads to the evolution of different geomorphological features and landscape. This course gives an idea of natural process in line with human approach of growth and development and how a mutual balance caters the human need in best possible ways.

Course Objectives

The objective of this course is to

1. **Understanding Earth Processes**: Acquaint students with the various processes operating on Earth.
2. **Geomorphological Evolution**: Explore how interactions between these processes lead to the evolution of different geomorphological features and landscapes.
3. **Natural Processes and Human Development**: Provide insights into natural processes in line with human approaches to growth and development.
4. **Balancing Needs**: Emphasize how maintaining a mutual balance between natural processes and human development can best cater to human needs.

Course Outcomes

CO1. Describe the different components of Earth's systems (Geosphere, Lithosphere, Hydrosphere, Cryosphere, Biosphere) and explain the concepts of isostasy and mountain-building processes.
CO2. Distinguish between endogenic and exogenic processes and their respective roles in shaping Earth's surface.
CO3. Analyze and classify the various types of weathering (physical, chemical, biological) and the agents responsible for these processes
CO4. evaluate and interpret the erosional, trans
portation, and depositional features formed by fluvial (rivers), aeolian (wind), and glacial processes.
CO5. ynthesize information on the interactions between different Earth surface processes and predict the potential impacts of these processes on various landforms and human activities.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Introduction to earth surface processes: Geosphere, Lithosphere, Hydrosphere, Cryosphere, Biosphere, Concept of Isostasy and Mountain building processes, Endogenic and Exogenic processes.	**L1, L2, L3**	**10**
Module II: Weathering, agents and types of weathering: Physical, Chemical and Biological weathering, Erosional, transportation and depositional processes, Fluvial processes: erosional, transportation and depositional features by river,	**L1, L5, L6**	**12**

DESC2102	MATHEMATICS	L	T	P	C
Version 1.1	Date of Approval:	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Course Objective: The objective of the course is to introduce the basic concept of Algebra, Matrices, Trigonometry and Differential calculus

Course Outcomes:
On completion of this course, the students will be able to:
CO1: Learn the concept of algebra where they will be different series like Exponential and logarithmic Series.
CO2: Learn different methods to find the roots of the equations.
CO3: Learn fundamental concepts of matrices like rank, eigen roots, eigen values, Cayley-Hamilton theorem
CO4: Learn different Trigonometric identities
CO5: Learn the concept of derivatives and its applications

Course Content

Modules	Bloom's level*	Number of hours
Module I: Algebra:Partial Fractions; Binomial, Exponential and logarithmic Series (without Proof); Summation; Simple problems. Theory of equations: Polynomial Equations with real Coefficients; Irrational roots and Complex roots; Transformation of equation by increasing or decreasing roots by a constant; Reciprocal equations; Newton's method to find a root approximately; Simple problems.	**L1, L2, L3**	**12**
Module II: Matrices:Symmetric; Skew-Symmetric; Orthogonal and Moduleary matrices; Rank of a matrix; Consistency of equations; Eigen roots and eigen vectors; Cayley-Hamilton theorem (without proof); Verification and computation of inverse matrix. Trigonometry:Expansions of sinn θ, cosn θ, sinnθ, cosnθ, tannθ; Expansions of sinθ, cosθ, tanθ in terms of θ; Hyperbolic and inverse hyperbolic functions; Logarithms of complex numbers.	**L1, L5, L6**	**10**
Module III: Differential calculus:n-th derivatives; Leibnitz theorem (without proof) and applications; Jacobians; Concepts of polar co-ordinates; Curvature and radius of curvature in Cartesian co-ordinates.	**L1, L4, L6**	**8**

*Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

DESC2103	BIOLOGY	L	T	P	C
Version 1.1	Date of Approval:	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course is the basic framework for the students of Earth Sciences. It will give an introduction to the evolution of living microorganisms, plants, animals and how the earth is evolved, evolution of life on earth started and how the living organisms came in to existence. The course is foundation for the basics of biology start from microbes to evolution of all direction of living biota, plants vertebrate and invertebrate animals taxonomy and their nomenclature.

Course Objectives

The objective of this course is to

1. Biology is essential to understand geological processes as it provides several vital clues about tracking process in past.
2. This course is meant to provide basic understanding of different forms of life and their organization which is pre-requisite for paleontology. The major thrust will be on the taxonomical classification of the plant and animal kingdom

Course Outcomes

On completion of this course, the students will be able to

CO1. Identify the process of origin of earth and evolution of living organisms.

CO2. Described Taxonomic Hierarchy: Taxonomic category and groups; Concepts of species, genus and family; Nomenclature: Principles and rules.

CO3. Demonstrate classification of plant and animal species based on their characteristics.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Introduction: Origin of life and their adaptation to various kinds of environments; Theories of evolution: Darwinism, Neo-Darwinism, Lamarckism and Neo-Lamarckism; Mode of speciation; Fossils and their significance; Zoogeographical and Phyto-geographical outline only.	**L1**	**10**
Module II: Taxonomic Hierarchy: Taxonomic category and groups; Concepts of species, genus and family; Nomenclature: Principles and rules, Ranks and names; Type method; Principle of priority and its limitations; Biological classification: Five Kingdom system; Basics of Plant & Animal Kingdom	**L1,L2**	**8**

VAES2101	ENVIRONMENTAL STUDIES (VAC-1)	L	T	P	C
Version 1.1	Date of Approval: Date, Month 2017	4	0	0	4
Pre-requisites/Exposure	Compulsory Value Added Course				
Co-requisites					

Course Catalog

This course gives an idea to find ways of living and working sustainably, so that the reasonable needs and wants of people from all walks of life can be satisfied without so over-exploiting the natural resources that the ability of future generations to meet their need and wants is threatened. Finding approaches to development that balance economic and social progress, address cultural differences, and respect ecological values and limits is the key to sustainable development.

Course Objectives

The objective of this course is to

- Describe the scope, importance and segments of environment and role of natural resources in expanding science and technologies.
- Understand the significance of biodiversity and its conservation, ecosystem processes and attain knowledge about sustainability.
- Reveals knowledge about environmental pollution and population explosion, their effects, control measures and related social issues. To also analyze the environmental issues in India and environmental management and legislation for the sustainable usage of environment.
- Description about value education, human rights, women and child welfare programmes and role of latest technologies in environmental management.
- Field work also forms the integral part of environmental issues so as to understand the theoretical concepts close to the ground realities.

Course Outcomes

On completion of this course, the students will be able to

CO1: Define the scope, importance and relation between environment and other segments of the society.

CO2: List and explain the significance of natural resources. Give in depth interpretation of the knowledge of various aspects of biodiversity and ecosystem processes.

CO3. Analyze and Examine environmental pollution, its effects and control measures and, assessing environmental impacts and livelihoods.

CO4: To illustrate the climate change and sustainable development. Analyze various social issues like consumerism, resettlement, rehabilitation, wasteland reclamation and environmental legislations.

CO5. To create awareness among the public towards sustainability through the use of different tools like environmental journalism and activism. Apply human rights, women and child welfare, population explosion and its control measures.

MODULES	Blooms level*	Number of hours
MODULE I: The multidisciplinary nature of environmental studies. Definition, scope and importance, Need for public awareness.	**L1, L2**	**8**
MODULE II: Natural Resources Renewable and non-renewable resources Natural resources and associated problems Forest resources: Use and over-exploitation, deforestation, case studies, timber extraction, mining, dams and their effects on forests and tribal people. Water resources: Use and over-utilization of surface and ground water, floods, drought, conflicts over water, dams-benefits and problems. Mineral resources: Use and exploitation, environmental effects of extracting and using mineral resources, case studies. Food resources: World food problems, changes caused by agriculture and overgrazing, effects of modern agriculture, fertilizer-pesticide problems, water logging, salinity, case studies. Energy resources: Growing energy needs, renewable and non-renewable energy sources, use of alternate energy sources, case studies. Land resources: Land as a resource, land degradation, man induced landslides, soil erosion and desertification. - Role of an individual in conservation of natural resources. - Equitable use of resources for sustainable lifestyles.	**L1, L2,L3, L5**	**12**
MODULE III: Ecosystems Concept of an ecosystem: Structure and function of an ecosystem, producers, consumers and decomposers, energy flow in the ecosystem, ecological succession, food chains, food webs and ecological pyramids, introduction, types, characteristic features, structure and function of the following ecosystems: a. Forest ecosystem b. Grassland ecosystem c. Desert ecosystem d. Aquatic ecosystems (ponds, streams, lakes, rivers, ocean estuaries).	**L2, L3**	**8**
MODULE IV: Biodiversity and its conservation Introduction, Definition: genetic, species and ecosystem diversity, biogeographical classification of India, value of biodiversity: consumptive use, productive use, social, ethical aesthetic and option values, biodiversity at global, national and local levels, India as a megadiversity nation, hot-spots of biodiversity, threats to biodiversity: habitat loss, poaching of wildlife, man wildlife conflicts, endangered and endemic species of India, conservation of biodiversity: in-situ and ex-situ conservation of biodiversity.	**L2, L3**	**12**
MODULE V: Environmental Pollution Definition, causes, effects, and control measures of: air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution, and nuclear pollution. Solid waste management: causes, effects and control measures of urban and industrial wastes, role of an individual in prevention of pollution, pollution case studies, disaster management: floods, earthquake, cyclone, and landslides.	**L1, L2, L3**	**5**
MODULE VI: Social Issues and the Environment From unsustainable to sustainable development, Urban problems related to energy Water conservation, rain water harvesting, and watershed management Resettlement and rehabilitation of people, its problems and concerns, case studies Environmental ethics: issues and possible solutions Climate change, global warming, acid rain, ozone layer depletion, nuclear accidents and holocaust, case studies Wasteland reclamation Consumerism and waste products Environmental Protection Act, Air (Prevention and Control of Pollution) Act, Water (Prevention	**L2, L3**	**5**

SEMESTER-II

DESC2251	PETROLOGY PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course is the basic framework for the students of Earth Sciences A basic course in earth sciences which deals with the origin, composition, distribution and structure of the rocks that have an origin from magma. The study of igneous rocks is important because they make up the bulk of the earth's crust in the geological time period.

Course Objectives

The objective of this course is to

1. Basic understanding of the three major types of rocks (Igneous, sedimentary and Metamorphic rocks).
2. To understand the different process involved in the formation of three types of rocks.

Course Outcomes

On completion of this course, the students will be able to

CO1. Describe, identify and differentiate among Igneous, sedimentary and metamorphic rocks

CO2. Describe the various process and environment in which Igneous, sedimentary and metamorphic rocks are formed.

CO3. Understand the mode of occurrence (temperature/ pressure conditions) of varios types of rocks based on texture and structure.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Introduction to Igneous petrology; its significance, distinguishing features of three types of rocks; concept of intrusion and extrusion; Magma: Definition, generation and crystallization and diversification of magma, Tectonic setting and igneous activities; Bowen's reaction principle and its petrological significance. Structure, textures and classification of igneous rocks.	**L1**	**15**
Module II: Basic concepts of Sedimentary, Description, and classification of Sedimentary rocks, Sedimentary texture and structures, Sedimentary Environments and facies, Weathering, and sedimentary flux; Fluid flow and its types, Sediment transport, and deposition; Submarine weathering, soils, and paleosols; Application of Sedimentary Petrology.	**L1, L2**	**15**
Module III: Introduction to Metamorphic Petrology; Factors controlling metamorphism; Types of metamorphism: contact, regional, fault zone metamorphism, impact metamorphism; Limitations of metamorphism; Diagenesis, Anataxis, Palingenesis. Concept of Zones, Facies, Grades and Isograds;	**L2, L4**	**20**

Prof. (Dr.) Anil Kumar

Manesar Gurgaon-122413

Metamorphic differentiation, prograde, retrograde, and poly-metamorphism; Metamorphic fluids and Metasomatism.		
Module IV: A field project based on petrology or Fields of specialization in petrology correspond to the aforementioned three major rock **types—igneous, sedimentary, and metamorphic**. Igneous petrology. Field project includes field observation followed by analysis, writing of short reports, presentation and review by peer.	**L3, L6**	**10**

*Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

DESC2201	GEOCHEMISTRY	L	T	P	C
Version 1.1	Date of Approval:	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course would provide various aspects of chemistry, with major thrust on the relative abundance, distribution and cycling of earth's chemical elements and their isotopes. This will also lay a foundation for analytical and conceptual concepts which would further be helpful for research in specialized areas much significant of earth sciences.

Course Objectives

The objective of this course is to

- To learn about fundamental geochemical methods and practices used in disciplines like aqueous biogeochemistry, trace element geochemistry, and isotope geochemistry.
- To give an integrated understanding of linkages in system with a perspective of space and time in earth system.
- To learn why and how geochemical reactions occur, and how they give rise to global biogeochemical cycling between reservoirs.

Course Outcomes

On completion of this course, the students will be able to

CO1. Understand the thermodynamic principals underlying modern geochemistry.

CO2. Understand the theoretical background, and practical application of commonly used techniques in geoscience research.

CO3. Study the composition, structure, processes, and other physical aspects of the Earth.

CO4. Examine the distribution of chemical elements in rocks and minerals, and the movement of these elements into soil and water systems.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Introduction: Earth in relation to the universe. The nature and age of the universe, nature and origin of solar system, composition of the universe, sun, planets and meteorites, cosmic abundance of elements. Geochemical cycle. Energy changes in the geochemical cycle. Methods for Geochemical analysis (Atomic Absorption spectrometry, electron microprobe Analysis, Mass spectrometry, ICP-MS, TEM)	**L1, L3**	**10**
Module II: Composition of the earth: the internal structure and composition of earth, composition of crust, composition of earth as a whole. Primary distribution of elements, geochemical classification of elements, distribution of elements in igneous, metamorphic and sedimentary rocks, partition coefficients.	**L1, L2**	**8**
Module III: Internal structure of atoms, nuclear systematics, atomic weights, and isotopes, nuclear stability and abundance. Decaying	**L1, L2, L3**	**12**

Prof. (Dr.) Anil Kumar

DESC2202	PHYSICS	L	T	P	C
Version 1.1	Date of Approval:	2	0	0	2
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The course is designed to develop an understanding of basics of physics which is intricately related to various sub-branches of earth sciences. This course will provide theoretical foundations of different geological processes including structural geology, stratigraphy, geo-tectonics, mass wasting, petrology, crystallography and mineralogy.

Course Objectives

The objective of this course is to

1. **Develop Fundamental Physics Knowledge**; Gain a thorough understanding of the basic principles of physics relevant to earth sciences.
2. **Explore Geological Processes**; Learn the theoretical foundations of various geological processes, including structural geology, stratigraphy, and geo-tectonics.
3. **Understand Geological Phenomena;** Study key concepts related to mass wasting, petrology, crystallography, and mineralogy.
4. **Integrate Physics and Earth Sciences**; Apply physics principles to analyze and interpret geological phenomena and processes.

Course Outcomes

On completion of this course, the students will be able to

CO1. Demonstrate a solid understanding of fundamental physics concepts as they apply to earth sciences.
CO2. Effectively analyze and interpret geological structures and processes, such as stratigraphy and geo-tectonics, using theoretical foundations.
CO3. Utilize physics-based methodologies to solve problems and conduct research in various sub-disciplines of earth sciences, such as mass wasting and petrology.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Elasticity: Hooke's Law, elastic constants, bending of beam, bending moment, Cantilever depression at the loaded end of a cantilever, determination of Young's modulus by non-uniform bending; Viscosity: viscosity of a liquid, viscous force, co-efficient of viscosity of a liquid, Poiseuille's formula, comparison of viscosities of two liquids by graduated burette method; Surface Tension: surface tension, excess of pressure inside a curved surface, Synclatic system, Surface Tension and interfacial surface tension by the method of drops. Heat:Specific heat, Newton's law of cooling, determination of specific heat of a liquid using Newton's law of cooling; Emissivity and Emissive Power; J.K. Effect, Positive &Negative Effect, Temperature of Inversion; Super conductors, Type I and II, Meisner Effect, Helium I & II.	**L1**	**10**

SEMESTER-III

DESC2351	STRUCTURAL GEOLOGY PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course deals with the study of the three-dimensional distribution of rock modules with respect to their deformational history. The study will make the students understand the structural evolution of a particular region and the important events which occurred in the regional geological past.

The field component of the course is a practical, field-based program which introduces the fundamentals of geologic mapping techniques in undeformed to simply folded and faulted and relatively unmetamorphosed sedimentary and igneous terrains.

Course Objectives

The objective of this course is to

1. The course provides a basic understanding of the forces driving deformation, and the displacements and strains associated with simple crustal deformations.
2. Introduce the basic concepts deformation processes, both brittle and ductile, and how they control the strength, mechanical behaviour and development of structures in the Earth's continental crust.
3. Illustrate how deformation processes change under the influence of changing pressures and temperatures with increasing depth in the lithosphere.

Course Outcomes

On completion of this course, the students will be able to

CO1. Recognize, interpret and discuss structures produced by simple crustal deformation.

CO2. Analyze the geometry of folds, faults, fractures, conformities, and evaluating the stress regimes that produced them.

CO3. Construct accurate geological maps and cross-sections and predict structures at depth and in areas of poor outcrop in simply folded and faulted regions.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Introduction, Attitude of beds; V's rule; dip and strike, Deformation, concept of stress and strain; Strain ellipses of different types and their geological significances.	**L1**	**15**
Module II: Folds morphology; Geometric and genetic classification of folds; Introduction to the mechanics of folding: Buckling, Bending, Flexural slip and flow folding; recognition in field and map, causes of folding. Top and bottom criteria of deformed strata. Fault: Concept and basics of Fault and Joint, classification, mechanism, significance, recognition in the field and map, general effects of faulting on outcrops. Joints - geometry, classification and significance, Outlier, Inlier, Nappe, Klippe and Window.	**L1, L2**	**15**

Prof. (Dr.) Anil Kumar

DESC2301	GEOPHYSICS & ENGINEERING GEOLOGY PLUS LAB	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The course is developed to give an insight about the physics of earth and the study of earth using quantitative physical methods. The course deals with the study of geological structures and their role in engineering structures and projects. Students are expected to develop an insight about the role of a geologist in such engineering projects.

Course Objectives

The objective of this course is to

1. Gain a comprehensive understanding of the physical principles governing the Earth and its geological processes.
2. Learn to use quantitative physical methods to study and analyze geological structures.
3. Understand the significance of geological structures in engineering projects and how they influence the design and stability of these structures.
4. Develop an appreciation for the crucial role of geologists in engineering projects, including their contributions to site assessment, risk analysis, and project planning.

Course Outcomes

On completion of this course, the students will be able to

CO1. Demonstrate a solid understanding of the physical principles related to Earth's geology.
CO2. Apply quantitative physical methods effectively to analyze and interpret geological structures.
CO3. Assess the impact of geological structures on engineering projects, ensuring design and structural integrity.
CO4. Appreciate and articulate the vital role of geologists in engineering projects, including site assessment and risk management.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Interrelationship between geology and geophysics; General and Exploration geophysics; Basic principles of geophysical exploration; Different types of geophysical methods. Role of geological and geophysical data in explaining geodynamical features of the earth. Geophysical Methods: Gravity, magnetic, Electrical, Seismic- their principles and applications.	**L1, L3**	**15**
Module II: Role of engineering geology in planning, design and construction of engineering structures. Geomechanical classification of rock mass (RMR, RQD, SMR). Engineering classification of Soils. Geotechnical components and classification of dams, reservoirs, spillways, tunnels, underground caverns, bridges, highways and shorelines.	**L1, L2**	**15**
Module III:	**L2, L3, L4, L5**	**15**

Prof. (Dr.) Anil Kumar

Geological structures and discontinuities, engineering properties of rocks, engineering properties of jointed rocks. Classification of construction materials and aggregates. Geological hazards (landslides and earthquakes) their significance, causes and preventive/remedial measures. Seismic zones of India, soil liquefaction.		
Module IV: Field related study includes computation of reservoir area, catchment area, reservoir capacity and reservoir life; Merits, demerits & remedial measures based upon geological cross sections of project sites; Computation of Index properties of rocks. 4. Computation of RQD, RSR, RMR and 'Q'	**L3, L4, L5**	**15**

SESC2301	REMOTE SENSING AND GIS	L	T	P	C
Version 1.1	Date of Approval:	2	0	2	3
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course will develop the skills of students in the field of GIS and remote sensing. It will also give the basic concepts of remote sensing and principles associated with image acquisition and image processing. The role of GIS as a tool in environmental management and knowledge of GPS will be facilitated.

Course Objectives

1. The course aims to equip students with fundamental theoretical knowledge and practical skills in utilizing remote sensing technologies and Geographic Information Systems (GIS) for spatial data analysis and interpretation.
2. Through lectures and hands-on lab sessions, students will learn to acquire, process, analyze, and visualize spatial data obtained from satellite imagery and other remote sensing platforms.
3. They will also gain proficiency in GIS software for spatial data management, spatial analysis, and cartographic representation.
4. The course emphasizes the application of these tools in environmental monitoring, urban planning, natural resource management, and other fields, preparing students for careers where spatial data analysis and GIS skills are essential.

Course Outcomes

1. **CO1: Understanding Remote Sensing Principles:** Students will demonstrate knowledge of remote sensing principles, including electromagnetic radiation, sensor types, and image acquisition techniques.
2. **CO2: Proficiency in GIS Software:** Students will develop proficiency in using GIS software to manipulate spatial data, perform spatial analysis, and create thematic maps.
3. **CO3: Image Processing and Interpretation:** Students will acquire skills in digital image processing techniques to enhance, classify, and interpret remotely sensed imagery for various applications.
4. **CO4: Spatial Data Analysis**: Students will apply spatial analysis techniques such as buffering, overlay analysis, and suitability modeling to solve spatial problems and make informed decisions.
5. **CO5: Project Work and Reporting**: Students will undertake a comprehensive GIS project that integrates remote sensing data, applying acquired skills to solve real-world spatial problems. They will effectively communicate their findings through reports, maps, and presentations.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Remote sensing: Introduction, scope and components; Electromagnetic spectrum, its characteristics and interaction with environment; Absorption, Transmission, Scattering: Mie-sattering & Rayleigh Scattering; Platforms: Types of Platform (Ground, Air, Space) & Sensors (Active & Passive) Resolution: (Spatial, Temporal, Radiometric); Ground & Satellite Remote Sensing; Albedo, Atmospheric Windows; Aerial photography, Elements of Visual Image Interpretation (Tone, Texture, Size, Shape, Shadow, Pattern), Spectral Signature	**L1, L2, L3, L4**	**15**

SEMESTER-IV

DESC2451	MINERALOGY PLUS LAB	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course is the basic framework for the students of Earth Sciences. The course will develop an understanding of the science behind the fundamental chemical, geometrical and physical relationship of matter. This course highlights the chemical and optical fundamentals to decipher structural symmetry of minerals and their optical properties.

Course Objectives

The objective of this course is to

1. Provide basic understanding of minerals, crystals and the process of their formation on or in the earth.
2. Provide knowledge of Physical, chemical and optical properties of various minerals.
3. Give insight about the major crystal system in which all the minerals crystallize.

Course Outcomes

On completion of this course, the students will be able to

CO1. Understand the processes and conditions involved in the formation of different minerals.
CO2. Describe and identify various minerals existed in a rock.
CO3. Understand the formation of rock types on the basis of optical properties of minerals.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Crystallography: Brief idea of space lattice; Definition and morphology of crystal and crystal notation; Symmetry elements; Parameter, indices and symbols, Laws of Crystallography; Stereographic Projection; Derivation of 32 classes of crystal; Study of following crystal systems: Isometric System, Tetragonal System, Hexagonal System, Orthogonal System, Monoclinic System, Triclinic System.	**L1**	**20**
Module II: Mineralogy: Definition and physical properties of Minerals; ions, bonds and their types, coordination number, Isomorphism, Polymorphism and Pseudomorphism; Structure of silicates; A detailed study of important rock forming mineral groups with reference to their composition, structure, physical and optical properties	**L1, L2**	**10**
Module III: Optical Mineralogy: Elementary concepts of light; Propagation of light through minerals, Principles of optical mineralogy;Introduction to Nicol Prism, Petrological Microscope and its functions; Crystal habits and twinning, laws of twinning, polarization, double refraction; Isotropism and Anisotropism;	**L2, L4**	**15**

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar

Important optical properties: Relief, Pleochroism, Pleochroic, Haloes, Extinction and Extinction angle, Birefringence, Interference colours; Behaviour of convergent polarized light in Uniaxial and Biaxial Minerals.		
Module IV: Study of physical properties of minerals; Introduction to optical microscopy; Study of optical properties of minerals; Study of physical properties of rocks; Study of optical properties of rock under thin sections; Understanding crystal symmetry via wodden models; Stereographic projection of mineral faces 8. Mineral formula calculation; Crystal chemical calculation 10. Introduction to analytical techniques for rock and mineral study	**L3, L6**	**15**

*Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

Suggested Books:

DESC2401	EXPLORATION & ECONOMIC GEOLOGY PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

Basic knowledge of the occurrence of the resources along with the techniques and statistical analysis associated with mineral exploration. This course will emphasize on the earth materials primarily used for economic and/or industrial purposes. This branch of earth sciences is extremely significant as it is used in geochemistry, mineralogy, geophysics, petrology, structural geology etc. Economic geology is of utmost concern for environmentalists, engineers and conservationists

Course Objectives

The objective of this course is to

- Develop a strong foundation in geological principles, including rock types, mineralogy, and geological structures. Understand the processes that form and alter mineral deposits.
- Learn to identify and classify different rock types and minerals in the field. Use field techniques to recognize and describe geological structures and formations.
- Understand the use of geological maps, cross-sections, and other surveying tools. Understand and apply geophysical survey techniques such as seismic, magnetic, and gravity methods in exploration.
- Assess the economic viability of mineral deposits through cost-benefit analysis and resource estimation.

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will develop practical skills in recognizing and interpreting geological features directly in the field, which are critical for professional work in exploration geology.

CO2. Understand and determine the economic potential of mineral deposits and making informed decisions regarding their development and exploitation.

CO3. Students will be adept at employing advanced technologies to enhance the accuracy and efficiency of geological investigations.

CO4. Develop to conduct their work with a strong awareness of safety, environmental stewardship, and professional ethics, ensuring responsible exploration and mining practices.

Course Content

Modules	Bloom's level*	Number of hours
Module I: **and gangues Ores**, gangue minerals, tenor, grade and lodes Resources and reserves- Economic and Academic definitions; Mineral deposits and Classical concepts of Ore formation Mineral occurrence, Mineral deposit and Ore deposit, Historical concepts of ore genesis: Man's earliest vocation- Mining Plutonist and Neptunist concepts of ore genesis.	**L1, L2, L3**	**20**
Module II:	**L1, L5, L6**	**15**

SESC2401	SURVEYING AND MAPPING	L	T	P	C
Version 1.1	Date of Approval:	2	0	2	3
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course will develop the skills of students in the field of surveying and mapping. It will also give the basic concepts of surveying and mapping and to promote planned, economic and artistic development of town, cities and rural areas.

Course Objectives

The objective of this course is to

1. Learn cadastral surveying which combines technical and legal knowledge to establish boundaries.
2. Analyze, manage, and disseminate geospatial data utilizing industry standard land surveying techniques.

Course Outcomes

On completion of this course, the students will be able to

CO1. Acquire knowledge and understanding of spatial data collection, analysis, management and presentation.
CO2. Design and acquire field survey measurements, process survey measurements to produce plans of appropriate accuracy and visual representation, incorporate data into geographical information systems
CO3. Recognize the requirements for designing plans of survey according to the needs of a project, understand the processes involved in representing the contiguous real world in a metric abstracted form.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Significance and Principles of Surveying, Survey methods- Compass, Tape, Chain, Plain Table, Theodolite, Electronic Distance Meter, Total Station; Contouring and Plotting, Measurement of slope heights, aspects and gradients; Use of abney level, Global Position System; Geodetic survey, Datum, survey of India topographical maps.	**L1**	**12**
Module II: Different type of maps: base maps, thematic maps. Main categories of thematic maps used in earth sciences; Techniques for legend and symbols in the maps; Scale of maps, classification of maps according to the scale, effect of the scale on the level of details of the information; Geographic projections and deformation of the real world in the maps; Coordinate systems;	**L1, L2**	**12**
Module III: Exercise of localization of points in the map using their coordinates; Representation of the 3rd dimension in the maps: isolines, elevation points; Exercises of estimation of slope and real distance in the maps; Landform identification from maps (identification of valleys, hills). Delineation of drainage basins. Construction of elevation profiles from maps.	**L2, L3, L4**	**12**

SEMESTER-V

DESC2551	STRATIGRAPHY & PALEONTOLOGY PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The students would explore study of strata (rock layers) and stratification (layering) in sedimentary and layered igneous rocks. It would also elaborate regional geology and tectonic evolution of India. The students would develop an understanding of the origin and evolution of the past life which is vital.

Course Objectives

The objective of this course is to

1. Explore and understand the formation, characteristics, and significance of rock layers and stratification in sedimentary and layered igneous rocks.
2. Gain detailed knowledge of the regional geology and tectonic evolution of India.
3. Analyze the processes and events that have shaped the tectonic structure of the Indian subcontinent.
4. Develop an understanding of paleontology, focusing on the origin and evolution of past life forms and their significance in Earth's history.

Course Outcomes

On completion of this course, the students will be able to

CO1. Demonstrate an understanding of the formation, characteristics, and importance of strata and stratification in sedimentary and igneous rocks.

CO2. Exhibit detailed knowledge of India's regional geology and its tectonic evolution.

CO3. Analyze and interpret the tectonic processes and events that have shaped the geological structure of the Indian subcontinent.

CO4. Demonstrate an understanding of the origin and evolution of past life forms, and appreciate their importance in the context of Earth's history.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Basic Concepts and Historical developments in Stratigraphy; Stratigraphic principles and correlation; Stratigraphic nomenclature; Facies concept and Walther's Law; Principles and methods of lithostratigraphy, Biostratigraphy and Chronostratigraphy; Magnetostratigraphy and Chemostratigraphy; Sequence Stratigraphy. Physiographic and tectonic subdivisions of India; regional geology and tectonic evolution of cratons; Geological Time Scale	**L1**	**17**
Module II: Precambrian of peninsula and extra-peninsula region, Stratigraphy and structure of Gondwana basins; Himalayan region; Marinemesozoic formations with reference to the Triassic deposits; Jurassic rocks of Kutch and Jaisalmer basins;	**L1, L2**	**17**

DESC2501	HYDROLOGY PLUS LAB	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course introduces students to the fundamental principles and applications of hydrology, focusing on the distribution, movement, and properties of water within the Earth's atmosphere, surface, and subsurface. Students will gain practical experience in analyzing hydrological processes, data collection methods, and interpretation techniques. Emphasis is placed on understanding the interactions between hydrological processes and environmental systems, as well as the implications for water resource management and sustainability.

Course Objectives

1. To provide fundamental understanding of hydrological principles and processes, including the distribution, movement and quality of water within natural systems.
2. Through theoretical knowledge, practical laboratory work and field exercises, students will develop skills in hydrological analysis and water resource management.

Course Outcomes

CO1. Understand Hydrological Principles: Demonstrate a comprehensive understanding of the fundamental principles governing the movement, distribution, and quality of water within terrestrial and aquatic environments.

CO2. Apply Quantitative Analysis: Apply quantitative techniques to analyze hydrological data, including precipitation, runoff, infiltration, and groundwater flow, using appropriate statistical and computational methods.

CO3. Interpret Hydrological Data: Interpret hydrological data to assess water availability, quality, and the impact of human activities on water resources, integrating knowledge of geological and environmental factors.

CO4. Hands-on Experience: Gain practical experience through laboratory experiments and fieldwork, using hydrological instruments to measure and analyze various parameters related to surface and groundwater systems.

CO5. Problem Solving in Water Resource Management: Apply hydrological principles to solve real-world problems related to water resource management, environmental sustainability, and the mitigation of hydrological hazards.

CO6. Communication Skills: Effectively communicate hydrological concepts, methodologies, and findings through written reports, oral presentations, and graphical representations suitable for both scientific and public audiences.

CO7. Ethical and Environmental Awareness: Recognize and evaluate ethical considerations in hydrology, including issues of water rights, conservation practices, and the environmental impacts of water use and management.

Course Content

swamps, caves, seas and oceans. Definition of river, river basin and water divide, formation of river valleys, flood plains, fluvial deposits, alluvial fans, meandering of rivers, formation of ox- bow or horse shoe lakes, deltas, solution valleys and karst topography Evaporation, Condensation and precipitation, Precipitation processes, Forms and types of Precipitation, Measurement of precipitation, Rain gauge network. Distribution and measurement of snow, Spatial and temporal variations of precipitation, Methods for point to aerial estimation of precipitation, Interpretation of precipitation data.		
Module II: Runoff and runoff mechanism, subsurface flow, Definition of discharge, units of discharge measurement, Types of measurements, Determination of stage, stage indicators, gauge site, essential requirements of gauge sites, selection of discharge sites, Stage discharge relationship and extension of rating curves, Flood and Drought, Water quality, Sediment discharge, sediment transportation, sediment yield of watersheds, suspended load and bed load measurements.	**L1,L2, L3, L4, L5**	**15**
Module III: Occurrence of Groundwater: Aquifer, Aquiclude, Aquifuge and Aquitard, Porosity, Effective porosity, Vertical distribution of Groundwater, Groundwater, Artificial Recharge of Groundwater: Concept, Recharge methods, Waste water recharge, Waste water treatment, Recharge mounds and Induced recharge, Surface, Atmosphere and Groundwater interaction, Climate change and water resources, Water resources and management.	**L1, L2,L3**	**17**
Module IV: Lab work Graphical representation of chemical quality data and water classification (C-S and Trilinear diagrams) Simple numerical problems related to: determination of permeability in field and laboratory, Groundwater flow, Well hydraulics etc	**L3, L4, L6**	**13**

*Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

DESC2502	PLANETORY SCIENCE PLUS LAB	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

To introduce the student to basic concepts in planetary science and the methods that are used to determine what we know about the dynamic processes of planetary formation and evolution. This will lay the foundation for understanding how our Solar System and the Earth was formed. We will study how we believe our planet has changed and evolved in the billions of years since its formation. One important part of this is the understanding of how different parts of our planet interact with each other dynamically.

Course Objectives

1. Introduce students to fundamental concepts in planetary science, including planetary formation and evolution.
2. Familiarize students with the methods and techniques used to determine the dynamic processes involved in planetary science.
3. Lay the foundation for understanding the formation and evolution of our Solar System and Earth over billions of years.
4. Investigate how different parts of the Earth interact dynamically, contributing to its ongoing changes and evolution.

Course Outcomes

1. **CO1: Understanding Planetary Formation and Evolution:** Students will demonstrate a comprehensive understanding of the processes involved in the formation of planetary systems, including the formation of planets, moons, asteroids, and comets, and how these bodies evolve over time.
2. **CO2: Interpretation of Planetary Surface Features:** Students will be able to analyze and interpret geological features observed on planetary surfaces, using data from spacecraft missions and telescopic observations.
3. **CO3: Proficiency in Planetary Data Analysis:** Students will develop skills in analyzing planetary data, including spectroscopic data, remote sensing imagery, and geological maps, to draw conclusions about planetary compositions, atmospheres, and geological processes.
4. **CO4: Hands-on Experience with Planetary Laboratory Techniques:** Students will gain practical experience in laboratory techniques such as spectroscopy, image analysis, and simulation of planetary processes, enhancing their ability to conduct scientific investigations in planetary science.
5. **CO5: Research and Presentation Skills:** Students will demonstrate the ability to conduct independent research projects in planetary science, culminating in the preparation of scientific reports, presentations, and/or posters that effectively communicate their findings and conclusions.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Milky Way and the solar system. Modern theories on the origin of the Earth and other planetary bodies. Earth's orbital parameters, Kepler's laws of planetary motion, Space and time scales of processes in the solid Earth, atmosphere and oceans, Radioactive isotopes and their applications. Meteorites Chemical composition and the Primary	**L1, L2, L3, L4**	**17**

SEMESTER-VI

DESC2651	GEOLOGY AND SOCIETY PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

Geology and Society is an interdisciplinary course that explores the interaction between geology and human society. The course examines the ways in which geology influences society and how human activities impact the Earth's geology. Students will gain an understanding of the geological processes that shape the Earth, the resources provided by the Earth, and the potential environmental and societal implications of geologic events. The course also covers the ethical considerations and challenges associated with geologic resource extraction, land use planning, and natural hazard mitigation.

Course Objectives

The objective of this course is to

1. Study the geological processes that shape the Earth and their influence on human society. Examine how human activities affect geological systems and the environment.
2. Evaluate the Earth's resources and the environmental and societal implications of geologic events.
3. Discuss ethical challenges in resource extraction, land use planning, and natural hazard mitigation.

Course Outcomes

On completion of this course, the students will be able to

CO1. Demonstrate a clear understanding of the geological processes that shape the Earth and their effects on human society.

CO2. Critically analyze the impact of human activities on geological systems and the resulting environmental consequences.

CO3. Assess the significance of Earth's resources and understand the environmental and societal implications of geologic events and resource extraction.

CO4. Apply ethical considerations and best practices to issues related to resource extraction, land use planning, and natural hazard mitigation.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Introduction to Geology and Society: Overview of the course, Importance of geology in understanding societal issues, Geological time and Earth's history, Earth's Structure and Plate Tectonics, Geological resources and their significance to society.	**L1**	**15**
Module II: Geologic Time and Fossils, Evolution and its relation to geology, Fossil fuels and alternative energy sources, Sustainable resource management, Groundwater resources and contamination, Geology's role in water management, Hydrological cycle and water availability, Climate Change and Geology, Geological evidence for climate change, Impacts of climate change on society, The role of geology in understanding past climates, Urban planning and infrastructure considerations.	**L1, L2**	**15**

DESC2601	OCEANOGRAPHY & ATMOSPHERIC SCIENCE PLUS LAB	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The aim of this course is to make the students aware of the various factors that play an important role in determining the physical and chemical characteristics of the marine water and the associated marine biota. The purpose of the course is to give a holistic understanding of the various processes and effects of the atmosphere on the other systems and vice versa. This will make the students aware with the fundamental concepts of the climate system and the changes taking place therein.

Course Objectives

The objective of this course is to

1. Study the physical and chemical properties of seawater and their spatial and temporal variations.
2. To give a holistic understanding of the various processes and effects of the atmosphere on the other systems and vice versa
3. Discuss the geological features of the ocean floor and the processes of seafloor spreading and plate tectonics.

Course Outcomes

On completion of this course, the students will be able to

CO1: Describe the physical and chemical properties of seawater and their spatial and temporal variations.
CO2: Explain the processes driving ocean circulation, including thermohaline and wind-driven currents.
CO3: Identify major marine ecosystems and understand the ecological interactions within them.
CO4: Discuss the geological features of the ocean floor and the processes of seafloor spreading and plate tectonics.
CO5: Utilize basic oceanographic instruments and techniques to collect and analyze data.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Introduction to Hydrological cycle; Origin and chemical composition of sea water; geomorphology and Relief of ocean floor; Vertical and horizontal distribution of temperature and salinity. Concepts of Eustasy; Ekman rule; Land-Air-Sea interactions; Oceanic current system and effect of Coriolis forces; waves and tides; Ocean currents, Global distribution of major ocean currents; Climate change and ocean; Sea level changes and its impact on coastal areas.	**L1**	**15**
Module II: Atmosphere: Structure and composition, vertical profile of temperature and pressure, microphysical processes in the atmosphere; Atmospheric physics: Earth's heat budget and radiative forcing; Fundamental forces: Pressure gradient force, centrifugal force, gravity force, Coriolis force; Buy Ballot law; Aurora Boreolis and Aurora Australis.	**L1, L2**	**15**
Module III: Introduction to components of climate science**;** Feedback mechanisms; Atmospheric thermodynamics, greenhouse gases and climate forcing; Heat transfer in ocean.	**L2, L3, L4**	**15**

Indian monsoon and its variability, western disturbances, Indian Ocean Dipole; El Niño-Southern Oscillation.		
Module IV: Practical exercises will include the analysis of ocean basin features, properties of seawater, the physical properties driving ocean currents, identification of marine organisms, and other related items. Atmospheric science experiments will include Sun photometry, Aerosols (aerosol particle measurments), Atmospheric dynamics - rotating tank experiments. Secondary database relevant exercises based on syllabus.	**L3, L5, L6**	**15**

*Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

Suggested Books:

DESC2602	ENVIRONMENTAL GEOLOGY & NATURAL HAZARDS PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This paper introduces the students to various environmental hazards, their causes, nature, preparedness and assessment of loss. It teaches them to model hazards and familiarizes them with methods of management of disasters and consequently risk zonation.

Course Objectives

The objective of this course is to

1. Develop a holistic understanding of the geology, biosphere,water resources and its management
2. To give an integrated understanding of natural hazard and its mitigation measures and management.

Course Outcomes

On completion of this course, the students will be able to

CO1. Identify the concepts of geology,ecology and biosphere.Understanding of climate change and its outcomes.

CO2. Identify the types of different natural hazard and its mitigation measures and management.

CO3. Description and assessment of Hazard assessment; Disaster preparedness: Preventive measures, Early warning system; Mitigation: Disaster Risk Reduction (DRR), Emergency Operation plan.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Human, Geology and the Environment, The Dynamic Earth systems, Foundational concepts; Solid Earth, Materials, and Processes Current environmental case study; Soils and Environment; Biosphere, Ecology, and Geology; Freshwater resources/water resources/water pollution/Hydrologic hazards at earth's surface.	**L1**	**15**
Module II: Water resources, water pollution, Hydrologic hazards at earth's surface; Energy resources and the Environment; Mineral resources, Environment and Society; Human and the earth systems, Understanding climatic and environmental change; Geology, Society, and the Future, Waste management and geology.	**L1,L2**	**15**
Module III: Natural hazards- prevention and precautions (earthquakes, floods, landslides, river and coastal erosion), impact assessment of urbanization, open cast mining and quarrying, river valley projects, disposal of industrial and radioactive waste, excess withdrawal of ground-water, use of fertilizers,	**L2, L4**	**18**

DESC2603	COAL AND PETROLEUM GEOLOGY PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course will deal with the geological aspects related to coal and petroleum. This is of utmost significance keeping in view the high employability opportunities associated with this branch of earth science.

Course Objectives

The objective of this course is to

1. Develop an in-depth understanding of the geological formations, processes, and characteristics associated with coal and petroleum deposit
2. Gain practical skills in the latest exploration and extraction techniques used in the coal and petroleum industry. This encompasses geological mapping, geophysical surveys, drilling, and sample analysis, enabling students to locate, evaluate, and exploit coal and hydrocarbon reserves effectively.

Course Outcomes

On completion of this course, the students will be able to:

CO1. Identification and analysis of coal and petroleum geological formations.
CO2. Gain proficiency in using exploration and extraction methods.
CO3. Be well-prepared for employment in the coal and petroleum industry.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Coal; Origin, types, ranks and uses; Coalification process; Coal Petrology: Lithotypes, Microlithotypes and macerals: Physical, chemical and optical properties; Maceral analysis: Mineral and organic matter in coal; Coal exploration and estimation of coal reserves; Applications of coal geology in hydrocarbon exploration; coal petrography of different coalfields of India. Coalbed methane: Elementary idea about generation of methane in coal beds and exploration	**L1, L3**	**15**
Module II: Natural occurrence, Chemical composition and physical properties of crudes in nature; Origin of petroleum, maturation of kerogen; Biogenic and thermal effect; Reservoir rocks: General attributes and petrophysical properties; Migration of oil and gas: Geologic framework and factors controlling hydrocarbon migration; migration routes and barriers.	**L1,L2**	**15**
Module III: Hydrocarbon traps: Definition, theory and classification of hydrocarbon traps - structural, stratigraphic and combination; Time of trap formation and hydrocarbon accumulation; Cap rocks: Definition and general properties; Formation water characteristics as oil exploration leads; Plate tectonics and global	**L2, L4, L5**	**16**

DESC2701	ADVANCE PETROLOGY PLUS LAB	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

A basic course in earth sciences which deals with the origin, composition, distribution, and structure of the rocks that have an origin from magma. The study of igneous rocks is important because they make up the bulk of the earth's crust in the geological time.

Course Objectives

The objective of this course is to

1. Develop a comprehensive understanding of the processes involved in the formation of igneous rocks, including magma generation, crystallization, and emplacement.
2. Learn to identify, describe, and classify igneous rocks based on their mineral composition, texture, and chemical properties.
3. Explore the distribution and structure of igneous rocks in the earth's crust and their significance in understanding geological history and processes.

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will be able to accurately identify and classify various igneous rocks and understand their formation processes.

CO2. Students will gain hands-on experience with field and laboratory techniques for studying igneous rocks, including petrographic microscopy and geochemical analysis.

CO3. Students will be equipped to analyze the distribution and structure of igneous rocks within the earth's crust and use this knowledge to interpret geological histories and processes.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Structure, textures and classification of igneous rocks; Concept of mode and norm; Phase rule and phase diagrams – binary and ternary systems. Petrogenesis of granite, alkaline rocks; Basalt, Anorthosite and Ultramafic rocks; Petrographic description of the following rock types: Granite, Rhyolite, Syenite, Nepheline-syenite, Monzonite, Granodiorite, Diorite, Pegmatite, Anorthosite, Gabbro, Dolerite, Basalt, Peridotite, Pyroxenite, Norite, Dunite, Trachyte and Andesite.	**L1**	**15**
Module II: Textures of clastic and non-clastic sedimentary rocks; Structures of sedimentary rocks; Lithification and Diagenesis; Provenance; Texture, composition, classification, origin and occurrence of Siliciclastic rocks: Conglomerates, Sandstones, Murdock's; Introduction to coal and petroleum.	**L1,L2**	**15**

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Non-siliciclastic rocks: Carbonate rocks, controls of carbonate deposition, limestone, dolomite and Dolomitization; Chert and siliceous sediments; Phosphorites, carbonaceous sediments, iron rich sediments and evaporates; Petrographic description of the major rock types: Conglomerate, Breccia, Sandstones, Arkose, Greywacke, Limestone, Dolomite, Shale.		
Module III: Paired metamorphic belts, Index minerals, Thermal and Regional metamorphism of argillaceous, calcareous and basic igneous rocks. Origin of Migmatites; Petrographic notes on the following metamorphic rocks: Slate, Phyllite, Schists, Gneisses, Amphibolites, Marble, Quartzites, Hornfels, Charnockite, Khondalite, Eclogite, Kodurite and Skarns.	**L2, L4**	**18**
Module IV: Lab work: Study of petrology in hand specimens and thin sections.	**L6**	**12**

*Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation

DESC2702	GEOINFORMATICS PLUS LAB	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

Preparing students to identify, analyze, and solve geospatial problems; raining students to develop practical and executable solutions to the challenges of the growing field of Remote Sensing and GIS; Introducing Geoinformatics as an advanced tool that consists of various advanced science and technologies used for mapping and managing earth resources.

Course Objectives

The objective of this course is to

1. Preparing Students to Identify, Analyze, and Solve Geospatial Problems.
2. Training Students to Develop Practical and Executable Solutions to Remote Sensing and GIS Challenges
3. Introducing Geoinformatics as an Advanced Tool for Mapping and Managing Earth Resources

Course Outcomes

On completion of this course, the students will be able to

CO1: Explain the fundamental concepts and components of geoinformatics, including GIS, remote sensing, and GPS.

CO2: Describe the principles of cartography and map design, including scale, projection, and symbolization.

CO3: Utilize geoinformatics software to create, manage, and analyze spatial data. Interpret and analyze satellite imagery and aerial photographs for various applications.

CO4: Understand the ethical considerations and best practices in the collection and use of geospatial data.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Electromagnetic Radiation – Characteristics and Remote Sensing Regions and bands; Spectra of common natural objects – soil, rock, water and vegetation; General Orbital characteristics of satellites; Concepts of radiometric, spectral, spatial and temporal resolutions of satellite sensors; Sensor characteristics of remote sensing satellites: Landsat, IRS, ASTER, Quickbird	**L1**	**15**
Module II: Aerial photography: Planning and Execution, types of aerial photography; Aerial photos: classification, scale, resolution, stereoscopic parallax, image displacement; Properties of vertical and inclined aerial photographs; Elements of image and photo interpretations, Interpretations keys Earth Model: Geoid, Authalic sphere and ellipsoid and their uses in GIS; Concept of datum: geocentric and local geodetic, horizontal and vertical; Co-ordinate systems: Geographic and planar; Concept of Map projections: Principal scale and scale factor, Concept of cylindrical, conical and planar map projections; Brief idea about	**L1,L2**	**15**

DESC2703	QUATERNARY GEOLOGY AND PALEOCLIMATE PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course focuses on global change during the recent geologic past and addresses changes in climatic, geomorphic, sedimentologic and biologic systems through the last 2.5 million years, and discusses the causes and implications of those changes. The course will focus on both theory and field understanding. The broad learning goals for this course are to understand the geologic history of the Quaternary on land and sea locally, regionally and globally.

Course Objectives

The objective of this course is to

1. Understand the patterns and causes of climatic changes and their implications for the Earth's future climate.
2. Investigate the evolution of geomorphic and sedimentologic systems, including the processes shaping landscapes and sediment deposits.
3. Explore changes in biological systems, including flora and fauna, and their interactions with environmental shifts during the Quaternary period.
4. Integrate theoretical knowledge with fieldwork to gain a comprehensive understanding of the Quaternary geologic history on local, regional, and global scales.

Course Outcomes

On completion of this course, the students will be able to

CO1. Demonstrate a comprehensive understanding of the climatic, geomorphic, sedimentologic, and biological changes that occurred during the Quaternary period.

CO2. Develop the ability to analyze and interpret geologic data related to the Quaternary period, both in theory and through fieldwork.

CO3. Apply critical thinking to assess the causes and implications of geologic changes over the past 2.5 million years on a local, regional, and global scale.

CO4. Exhibit proficiency in conducting geologic research, including data collection, analysis, and presentation of findings related to Quaternary geology.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Geological Time scale, Recent Geological past: Ceonozoic era, and Quaternary period. Quaternary Stratigraphy, Climate-governing processes, Important events of the Quaternary period, climatic, geomorphic and biological changes. Quaternary climates – glacial- interglacial cycles, eustatic changes, proxy indicators of paleoenvironmental/ paleoclimatic changes, - land, ocean and cryosphere (ice core studies).	**L1**	**11**
Module II: Approaches to understand and study Quaternary Geology. Responses of geomorphic systems to climate, sea level and tectonics on variable time scales in the Quaternary. Correlating events and changes: Dating methods. Reconstruction	**L1, L2**	**12**

of climate changes based natural environmental archives and climate proxies. Neotectonics; Climate and glaciation history of Earth; Sea-level change during Quaternary.		
Module III: Quaternary stratigraphy of India– continental and marine records; continental- marine correlation of Quaternary record. Humans evolution in relation to the climatic and environmental development before and during the Quaternary. Plant and animal life in relation to glacial and interglacial cycles during Quaternary.	**L2, L3, L4**	**12**
Module IV: A field project on relevant quaternary areas to develop skills of geomorphic and sedimentologic observation. Field project includes field observation of lacustrine/fluvia/aeolian/glacial stratigraphy followed by analysis, writing of short reports, presentation and review by peer.	**L3, L5, L6**	**13**

DESC2704	HYDROGEOLOGY	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The course is designed to make the students aware about the peculiarities of the availability and movement of sub-surface and surface water. The various geological characteristics of ground water and surface water will be dealt with. To provide students with a comprehensive knowledge base and practical skills necessary to address complex challenges related to groundwater resources and environmental sustainability.

Course Objectives

To provide students with a comprehensive understanding of groundwater systems and their management. Understand the basic principles of hydrogeology, including the movement of water in the subsurface, groundwater flow, aquifer properties, and the interactions between surface water and groundwater. To equip students with theoretical knowledge, practical skills, and critical thinking abilities necessary for careers in groundwater management, environmental consulting, water resource engineering, and research.

Course Outcomes

CO1. Understanding Hydrogeological Principles: Gain a thorough understanding of the fundamental principles governing groundwater flow, aquifer properties, and the interactions between surface water and groundwater.

CO2. Analyzing Groundwater Systems: Develop skills to analyze and interpret geological and hydrological data to characterize groundwater systems, including aquifer types, groundwater recharge mechanisms, and flow dynamics.

CO3. Assessing Groundwater Quality and Contamination: Learn methods to assess groundwater quality, identify sources of contamination, and evaluate the potential risks to human health and the environment.

CO4. Applying Hydrogeological Techniques: Acquire practical experience in applying hydrogeological techniques such as groundwater sampling, aquifer testing, and data interpretation to solve real-world problems and make informed decisions.

CO5 Integrating Hydrogeology with Environmental Management: Understand the role of hydrogeology in environmental management, including groundwater resource assessment, sustainable development practices, and remediation strategies for contaminated sites.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Scope and significance of hydrogeology Hydrological cycle (Precipitation, Evapo-transpiration, Runoff, and infiltration), Groundwater, Sub-surface movement of water, flow in saturated and unsaturated zones; Vertical distribution of sub-surface water, Origin and age of groundwater, Sub surface hydrogeology: Types, characteristics, classification of aquifers, Porous and Fractured aquifers	**L1, L2, L3, L4**	**15**
Module II:	**L1,L2, L3, L4, L5**	**15**

DESC2739	BASICS OF RESEARCH METHODOLOGY, ETHICS, AND RESEARCH COMMUNICATION	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description

This course aims to provide students with a comprehensive understanding of conducting ethical research, utilizing proper research methodologies, and effectively communicating research findings. The course includes a final project where students will write a Literature Review on a topic chosen in consultation with the teacher(s).

This course is designed to equip students with essential skills and knowledge to conduct ethical research, employ proper research methodologies, and effectively communicate scientific information (with focus on writing a literature review). The course will cover topics such as research design, data collection and analysis, research ethics, and science communication strategies. Through a combination of lectures, discussions, case studies, and practical exercises, students will develop a deeper understanding of the research process and its ethical implications.

Course Objectives

The objective of this course is to impart knowledge about various stages of research process, research ethics and different ways of research communication.

The aim of this course is to impart research skills to the beginners and help to improve the quality of research by the existing researchers. It also encompasses the understanding and application of appropriate research design, statistics, and the use of the computer for reference management, report writing, research paper writing and presentation. The course also introduces the key conceptual issues of each research method, as well as giving practical guidance. It covers the series of research methodology contents: from problem formulation, to design, to data collection, analysis, reporting and dissemination. The course has the dual aims of equipping students with conceptual understandings of current academic debates regarding different methods, and the practical skills to put those methods into practice.

Course Outcomes

On completion of this course, the students will be able to

CO1. Define criteria of good research, steps in research process, and data collection.

CO2. Identify different types of sampling and its purpose.

CO3. Conduct hypothesis testing for different types of samples and interpret the results.

CO4: Learn the importance of literature review, write research paper/thesis, use reference management software.

Course Content :

SEMESTER-VIII

DESC2801	GEOMORPHOLOGY PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The objectives of this course are to introduce the concepts in Geomorphology in adequate manner, many facets of surface relief features and to understand various aspects of their growth and evolution on the Earth.

Course Objectives

1. Understand the processes and mechanisms that drive the growth and evolution of surface relief features on Earth.
2. Analyze various geomorphic processes such as weathering, erosion, deposition, and tectonic activities.
3. Evaluate the impact of these processes on landscape formation and transformation over time.

Course Outcomes

CO1. Explain the basic concepts and historical development of geomorphology and define terrestrial relief and scales in geomorphology,

CO2. Describe the normal cycle of erosion and the concept of peneplain and evaluate the factors affecting hill slope stability and the processes of mass movements, and also classify different types of soil based on their characteristics and formation processes

CO3. Explain the concept of watershed and the organization of drainage systems and patterns, and able to apply remote sensing and GIS technologies in geomorphic studies and applications,

CO4. Explain the concept of basin morphometry and its linear aspects, including stream ordering, bifurcation ratio, and the laws of stream numbers and lengths, and assess relief aspects such as relative relief, dissection index, and channel slope laws.

Course Content

Modules	Bloom's level*	Number of hours
Module I : Basic concepts of geomorphology and its historical development, Terrestrial relief and scales in geomorphology; nature and scope; Normal cycle of erosion, Peneplain, Hill Slope Stability and Mass movements; Types of mass movement, Classification, causes, and prevention, Soil: formation of soil, soil profile, classification of soil.	**L1, L2, L3, L4**	**15**
Module II: Valley Development: Valley Deepening, Valley Widening and Lengthening; Concept of watershed, Drainage system and pattern, Major Drainage basins in India, Sand dunes classifications, Lake types and associated features, Wetland, Major wetland regions of India, Remote sensing and GIS as tools in geomorphic applications.	**L1,L2, L3, L4, L5**	**15**
Module III: Drainage basin, Morphometry of drainage basin: basin morphometry, linear aspects: stream ordering, bifurcation ratio, the law of stream numbers, length ratio, law of stream length: geometry of basin shape, the law of basin perimeter, basin length, and basin	**L1, L2,L3**	**15**

DESC2802	CLIMATE SCIENCE PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue
This course will deal with the diverse aspects related to Climate science. This course is of utmost importance keeping in view the high employability opportunities associated with this branch of earth science.

Course Objectives
1. Comprehend the fundamental principles and concepts of climate science.
2. Analyze the various factors influencing climate patterns and changes.
3.Evaluate the impact of climate science on employability and career opportunities in earth science.

Course Outcomes
CO1: Describe the fundamental components of the Earth's climate system and their interactions.
CO2: Explain the physical processes governing the atmosphere, oceans, and cryosphere. Plan and conduct field experiments to measure atmospheric and oceanic parameters.
CO3: Analyze historical climate data to identify trends and patterns in climate variability and change. Use field instruments and techniques to collect data on temperature, precipitation, wind speed, and other climate variables.
CO4: Discuss the natural and anthropogenic factors driving climate change.
CO5: Utilize climate models to simulate past, present, and future climate scenarios. Present field study findings and analyses in written reports and oral presentations.

Course Content

Modules	Bloom's level*	Number of hours
Module I: **Climate and Weather:** Definition of weather and climate, meteorology and climatology, elements, types of classification systems- empirical, applied and genetic systems, Koeppen classification system: three basic climate groups: low latitude, mid-latitude, high latitude; Aridity index, drought, Holdridge life zones system: global bioclimatic scheme for the classification of land areas; Weather and climate change, Polar ice, Isotopes, Ice melting and Ice core analysis; Sea level changes and Shore line changes (Strand lines) and Temperature changes; Introduction to Paleoclimatology : Major events: Oceanic Anoxic Events ,Holocene climatic optimum , Paleocene–Eocene Thermal Maximum.	**L1, L2, L3, L4**	**15**
Module II: Climate indices and extreme events: Measurement of various climate indices, aridity index, Seismic activity, Remote sensing data for temperature and precipitation; Formation, structure, types and impacts of Cyclone , Thunderstorms, winter storms, summer storms, Tornadoes and Hurricanes; Formation, structure,	**L1,L2, L3, L4, L5**	**15**

types and impacts of Floods , droughts, precipitation, El nino and arctic circulation, Heat waves, Wild fires, Health effects, Heinrich events and Daansgard-Oeschger (D-O) events		
Module III: Atmospheric chemistry: Measures of atmospheric composition: Mixing ration, number density and partial pressure; Atmospheric transport: Geostrophic flow, General circulation, Vertical transport, turbulence; Atmospheric lifetime and time-scales: Definition, Box models, Source and Sinks mechanism, Atmospheric lifetime of Kyoto gases and sink mechanisms.	**L1, L2,L3**	**15**
Module IV: Field Work: 1. Study of distribution of major climatic regimes of India on map 2. Distribution of major wind patterns on World map 3. Preparation of paleogeographic maps (distribution of land and sea) of India during specific geological time intervals 4. Numerical exercises on interpretation of proxy records for paleoclimate.	**L3, L4, L6**	**15**

DESC2803	CO-EVOLUTION OF EARTH AND LIFE PLUS FIELD	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The objective of this course is to explore the intricate co-evolution of Earth and life, emphasizing the interconnected development of geological and biological systems over time. Through a combination of theoretical learning and practical fieldwork, students will investigate how life has influenced and been influenced by Earth's dynamic processes. The course aims to provide a comprehensive understanding of the reciprocal relationships between Earth's environment and the evolution of life, preparing students for advanced studies and careers in earth and life sciences.

Course Objectives

1. Explore the reciprocal relationships between Earth's geological processes and the evolution of life.
2. Investigate how life has influenced Earth's environment through biogeochemical cycles and ecosystem interactions.
3. Conduct fieldwork to observe and analyze the co-evolution of geological and biological systems in natural settings.

Course Outcomes

CO1: Demonstrate a comprehensive understanding of the reciprocal relationships between Earth's geological processes and the evolution of life.
CO2: Analyze the impact of biogeochemical cycles and ecosystem interactions on Earth's environment and life forms.
CO3: Apply theoretical knowledge through fieldwork to observe and interpret the co-evolution of geological and biological systems.
CO4: Develop skills in conducting scientific research and data analysis related to Earth and life sciences.

Course Content

Modules	Bloom's level*	Number of hours
Module I : Life through ages: Fossils and chemical remains of ancient life. Geological Time Scale with emphasis on major bio-events. Fossilization processes and modes of fossil preservation. Exceptional preservation sites- age and fauna; Geobiology: Biosphere as a system, processes and products Biogeochemical cycles Abundance and diversity of microbes	**L1, L2, L3, L4**	**15**
Module II: Origin of life: Possible life sustaining sites in the solar system, life sustaining elements and isotope records Archean life: Earth's oldest life, Transition from Archean to Proterozoic, the oxygen revolution and radiation of life Precambrian macrofossils; Biomineralization and skeletalization	**L1,L2, L3, L4, L5**	**15**
Module III: Paleozoic Life: The Cambrian Explosion. Biomineralization and skeletalization Origin of vertebrates and radiation of fishes Origin of tetrapods – Life out of water Early land plants and impact of land vegetation Mesozoic Life: Life after the	**L1, L2,L3**	**15**

DESC2804	BASICS OF CRYOSPHERE	L	T	P	C
Version 1.1	Date of Approval:	2	1	2	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This course focuses on components of the cryosphere and processes linking them to other parts of the Earth system and contemporary challenges including climate change. It illustrate the processes and factors affecting ice dynamics and glacier mass balance and explains how cold climate indicators are preserved in the geomorphological and sedimentological records. This course work outline how each component of the Cryosphere has changed in recent decades, and explain the wider impacts these changes are having.

Course Objectives

The objective of this course is to

1. Gain a comprehensive understanding of the components of the cryosphere and their connections to other parts of the Earth system.
2. Illustrate and analyze the processes and factors affecting ice dynamics and glacier mass balance.
3. Explain how cold climate indicators are preserved in geomorphological and sedimentological records.
4. Outline recent changes in cryosphere components and evaluate the wider impacts of these changes, including those related to climate change.

Course Outcomes

CO1. Demonstrate a thorough understanding of the components of the cryosphere and their interactions with other Earth system components.

CO2. Develop the ability to analyze ice dynamics and glacier mass balance, including understanding the processes and factors influencing these systems.

CO3. Exhibit proficiency in interpreting cold climate indicators from geomorphological and sedimentological records.

CO4. Evaluate and articulate the recent changes in cryosphere components and their broader impacts, particularly in the context of climate change.

Course Content

Modules	Bloom's level*	Number of hours
Module I: Cryosphere: Global and regional distribution of glaciers, Glacial types and features, Mineralogy of ice/Metamorphism of ice, terminology of glacial study. Annual/seasonal glacial cycle, accumulation and ice changes. Ice mechanical processes and glacial dynamics, Concept of mass balance and its significance.	**L1**	**12**
Module II: Glacial geomorphology: glacial landscape, glacial profile, evolution of landscape, erosional and depositional features. Glaciers and India, Himalayan glaciers and their significance, third pole. Glacial hydrology in context of Indian sub-continent.	**L1, L2**	**12**

DESC2839	DATA ANALYSIS & VISUALISATION USING SOFTWARE	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	Class X Mathematics				
Co-requisites					

Catalog Description

The implosion of available data has made visualization more critical but also more challenging. Data analysis and Data Visualization are essential tools for business analysis, engineers, policymakers, and decision-makers. Developed originally for "small data", visualization techniques have been met with varied success in the past centuries and decades. There are a few well-known visualizations that are very effective in capturing the essence of the data, and of course, there are many infamous negative examples of poor visuals. An effective visual is critical for decision making it, but it also requires a lot of work, customization, attention to detail, and refinements.

Course Objectives

The course is designed to help students develop skills and knowledge in the following area(s):

- Develop an understanding of what is a good visualization for a given purpose
- Learn visualization theory & techniques
- Build a substantial data analytic project
- Apply data analysis and visualization with Excel, SPSS, R, Python, NVivo and MATLAB

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will be able to articulate meaningful lines of inquiry that might be explored through the collection, organization, visualization, and analysis of data in a context associated with their primary field of study using (as appropriate) numerical, textual, spatial, and/ or visual data.

CO2. Student will understand what data are, how they are collected, and how to assess the quality/ reliability of data.

CO3. Students will demonstrate intermediate proficiency in the visualization of data to communicate information and patterns that exist in the data.

CO4: Students will be able to use at beginning level of proficiency the tools of statistics and machine learning to ask questions of and explore patterns in data.

Course Content :

Module	Topics Covered	Blooms Level	Contact Hours
1	**Module-1: Introduction to Excel** Data Analysis using Excel, Curve fitting, Correlation, Linear Regression, Multiple regression, Principal Component Analysis and Factor Analysis, Hypothesis testing	L1, L2, L3, L4	20 hours

ENVIRONMENTAL STUDIES

VAES2101/ ENV2152/ ENV2252	**ENVIRONMENTAL STUDIES**	L	T	P	C
Version 1.1	Date of Approval: Date, Month 2017	4	0	0	4
Pre-requisites/Exposure	Compulsory Value Added Course				
Co-requisites					

Course Catalog

This course gives an idea to find ways of living and working sustainably, so that the reasonable needs and wants of people from all walks of life can be satisfied without so over-exploiting the natural resources that the ability of future generations to meet their need and wants is threatened. Finding approaches to development that balance economic and social progress, address cultural differences, and respect ecological values and limits is the key to sustainable development.

Course Objectives

The objective of this course is to

- Describe the scope, importance and segments of environment and role of natural resources in expanding science and technologies.
- Understand the significance of biodiversity and its conservation, ecosystem processes and attain knowledge about sustainability.
- Reveals knowledge about environmental pollution and population explosion, their effects, control measures and related social issues. To also analyze the environmental issues in India and environmental management and legislation for the sustainable usage of environment.
- Description about value education, human rights, women and child welfare programmes and role of latest technologies in environmental management.
- Field work also forms the integral part of environmental issues so as to understand the theoretical concepts close to the ground realities.

Course Outcomes

On completion of this course, the students will be able to

CO1: Define the scope, importance and relation between environment and other segments of the society.

CO2: List and explain the significance of natural resources. Give in depth interpretation of the knowledge of various aspects of biodiversity and ecosystem processes.

CO3. Analyze and Examine environmental pollution, its effects and control measures and, assessing environmental impacts and livelihoods.

CO4: To illustrate the climate change and sustainable development. Analyze various social issues like consumerism, resettlement, rehabilitation, wasteland reclamation and environmental legislations.

CO5. To create awareness among the public towards sustainability through the use of different tools like environmental journalism and activism. Apply human rights, women and child welfare, population explosion and its control measures.

Course Content

MODULES	Blooms level*	Number of hours
MODULE I: The multidisciplinary nature of environmental studies. Definition, scope and importance, Need for public awareness.	**L1, L2**	**8**
MODULE II: Natural Resources Renewable and non-renewable resources Natural resources and associated problems Forest resources: Use and over-exploitation, deforestation, case studies, timber extraction, mining, dams and their effects on forests and tribal people. Water resources: Use and over-utilization of surface and ground water, floods, drought, conflicts over water, dams-benefits and problems. Mineral resources: Use and exploitation, environmental effects of extracting and using mineral resources, case studies. Food resources: World food problems, changes caused by agriculture and overgrazing, effects of modern agriculture, fertilizer-pesticide problems, water logging, salinity, case studies. Energy resources: Growing energy needs, renewable and non-renewable energy sources, use of alternate energy sources, case studies. Land resources: Land as a resource, land degradation, man induced landslides, soil erosion and desertification. - Role of an individual in conservation of natural resources. - Equitable use of resources for sustainable lifestyles.	**L1, L2,L3, L5**	**12**
MODULE III: Ecosystems Concept of an ecosystem: Structure and function of an ecosystem, producers, consumers and decomposers, energy flow in the ecosystem, ecological succession, food chains, food webs and ecological pyramids, introduction, types, characteristic features, structure and function of the following ecosystems: a. Forest ecosystem b. Grassland ecosystem c. Desert ecosystem d. Aquatic ecosystems (ponds, streams, lakes, rivers, ocean estuaries).	**L2, L3**	**8**
MODULE IV: Biodiversity and its conservation Introduction, Definition: genetic, species and ecosystem diversity, biogeographical classification of India, value of biodiversity: consumptive use, productive use, social, ethical aesthetic and option values, biodiversity at global, national and local levels, India as a megadiversity nation, hot-spots of biodiversity, threats to biodiversity: habitat loss, poaching of wildlife, man wildlife conflicts, endangered and endemic species of India, conservation of biodiversity: in-situ and ex-situ conservation of biodiversity.	**L2, L3**	**12**
MODULE V: Environmental Pollution Definition, causes, effects, and control measures of: air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution, and nuclear pollution. Solid waste management: causes, effects and control measures of urban and industrial wastes, role of an individual in prevention of pollution, pollution case studies, disaster management: floods, earthquake, cyclone, and landslides.	**L1, L2, L3**	**5**

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

ENVIRONMENTAL MANAGEMENT

Syllabus - Semester Third

ENVIRONMENTAL POLLUTION AND WASTE MANAGEMENT

Course Code: ENV2351 **Credit Units: 3**

Course Objective:
The growing pressure on natural resources and the progressive increase in the production of waste poses serious challenges for our society. Waste production and management play a central role in environmental policy. The production of industrial and urban waste has exploded during the last ten years. From a modern viewpoint, waste is to be considered a lost resource and, hence, it is a manufacturing cost variable that must be optimized with both direct costs and the cost to society in mind. Since it is not possible to avoid the production of waste, the main objective in order of importance is to try to reduce it to a minimum.

Course Contents:
Module I: Water pollution – sources, types, and effect of water pollutants, water quality standards, algal bloom, eutrophication, biomagnification/ bioaccumulation, water pollution control - primary, secondary and tertiary wastewater treatment; **Soil Pollution** – soil pollutants – types, sources, effects, and control.

Module II: Air pollution – structure and composition of atmosphere, classification, sources and effects of air pollutants, air pollution control - particulate and gaseous emission control methods; acid rain, green house effect, global warming, ozone depletion, smog, climate change, **Noise Pollution** – sources, effects, and control.

Module III: Waste management: Methods of waste collection, storage, and transportation, treatment and disposal techniques for solid waste: landfill operation and maintenance, composting: advantages and limitations, vermin-composting, autoclaving, incineration, biogas plant, techniques for hazardous waste treatment and safe disposal, nuclear and e-waste management, Government agencies and programs: NCEPC, MoEFCC, CPCB and SPCB's.

Examination Scheme:

Syllabus - Semester Fourth

ENVIRONMENTAL MANAGEMENT AND INDUSTRIAL SAFETY

Course Code: ENV2451 **Credit Units: 03**

Course Objective:
The course will give an overview of the safety and environmental issues in the industry. It will provide detailed understanding of the methods and techniques to resolve these key issues for making production and processing cleaner and safer. This course would educate students to identify and assess hazards in any stage of operation, to quantify and manage them as well. This course will also highlight lessons learnt from the past accidents. The aims of this course are: to create awareness for quality of life protection, health and environmental safety, occupational hazards.

Course Contents:
Module I: Public health: definition, need for good health, factors affecting health, communicable diseases, mode of transmission (epidemic and endemic diseases), management of hygiene in public places, occupational health hazards and safety (physical, chemical and biological), health protection measures for workers- health education, first aid, management of medical emergencies.

Module II: Industrial safety and management techniques: industrial safety standards and regulations, accidents – definition, prevention and control, risk analysis and assessment, safety cost and expenses.

Module III: Safety management system - environmental management systems (EMS) ISO 14000 and 14001, OSHA and NIOSH, compensation act, public liability insurance act, mining act, good manufacturing practices (GMP) and good laboratory management practices (GLP).

Examination Scheme:

Syllabus - Semester Fifth

ENVIRONMENTAL ECONOMICS AND GLOBALIZATION

Course Code: ENV2551 **Credit Units: 03**

Course Objective:
Environmental issues such as pollution, climate change and the conservation of biodiversity are currently in the headlines of economic debate. Economic analysis of the environment is challenging precisely because environmental value is not always conveniently revealed in a market, and thus is subject to inappropriate use. The major topics addressed in this field of study are: the causes of environmental degradation, the need to re-establish the disciplinary ties between ecology and economics, the difficulties associated with assigning ownership right to environmental resources, the trade-off between environmental degradation and economic goods and services, assessing the monetary value of environmental damage etc.

Course Content:

Module I: Introduction: definition and scope of environmental economics, economics and environment, environment inter-linkages, market failure and externality, accounting for the environment.

Module II: Resource economics: natural resources: types and classification, economics of natural resources exploitation, market structure and the exploitation of non-renewable resources, methods of valuation of environmental costs and benefits.

Module III: Economics & Environmental Management: WTO and international trade, environmental trade barriers, natural resource accounting, environmental communication, GRI reports, green marketing, eco-labeling, pollution control: basic approach to environmental policy and management, pollution tax: effluent charges and subsidies.

Examination Scheme:

Components	CT	HA	S/V/Q	A	EE

SUSTAINABLE DEVELOPMENT PRACTICES

Course Code: ENV2651 **Credit Units: 03**

Course Objective

Finding approaches to development that balance economic and social progress, address cultural differences, and respect ecological values and limits is the key to sustainable development. Moving towards this goal requires fundamental changes in human attitudes and behavior in our personal lives, in our community activities, and in our places of work. The success in this regard is critically dependent on education and training. This course will imbue students with respect for the conservation and sustainable use of resources, social equity, and appropriate development along with competencies to practice sustainable tasks at the workplace of today and tomorrow.

Course Content:

Module I: Introduction: Environment, sustainable development and globalization, millennium development goals, regional perspectives, challenges and environmental issues in India, sustainable development and Indian development policies, local environmental management and legislation.

Module II: Climate change and sustainable development: Climate change and sustainable development, climate change and forest management, sustainable consumption, strategies and issues, international environmental agreements and climate change, international environmental agreements and climate change.

Module III: Writing on environment: Environmentalism, environmental journalism and activism, media for environment, conventions and science article styles, fact-checking with sources, research and publication, green peace movement, UNEP, UNCED, WBCSD, WWF, WRI, GRI, and World Bank.

Examination Scheme:

Manesar Gurgaon-122413

Background

The program describes health issues, originated by air/water/soil pollution, scientific understanding of causes and possible approaches to mitigate and control the major environmental health problems in automobile/industry sectors of developing countries. Finally, the course addresses the pathways that connect pollution, human health and climate change at local/regional/global scale. Topics illustrate how the human body reacts with environmental pollutants; physicochemical, dynamical and biological agents of environmental contamination; vectors for dissemination (air, water, soil); solid and hazardous waste; susceptible populations; biomarkers, risk analysis and climate change; the scientific basis for policy decisions; and emerging global environmental health problems. This course also emphasizes the feedback mechanisms and pathways that interplay between air pollution, human health and climate parameters over different environments in a cohort hybrid seamless model, emphasizing integrated approach.

Objectives

Advancing Environmental Health and Climate (EHC) encompasses the study of all levels of biological organization, biochemical pathways, population at all stages across the lifespan, and climate change. EHC uses a rich, diverse, and constantly evolving set of outdoor/indoor observational, experimental, computational, and clinical approaches to explore the impacts of varying levels of exposure and susceptibility to such exposure. The support of novel, cutting-edge research approaches, high risk for high reward, and mitigation methods is an important element of the advancing EHC theme in this program.

ENVIRONMENTAL HEALTH & CLIMATE

Syllabus - Semester First

LINKAGES BETWEEN ENVIRONMENT & HEALTH

Course Code: AST2152 **Credit Units: 03**

Course Objectives: To teach students the essential concepts on environment-related health problems, such as asthma and neurological damage from lead exposure, affect children disproportionately. A number of efforts are under way around the nation to educate children about the concepts and principles of environmental health with the goal of expanding science education, empowering children to avoid some adverse environmental exposures, and helping them to grow in to informed citizens who can assess and affect important public health issues.

Course Contents

Module-I: Environment and Public Health
The environment at risk: Converging paradigms for environmental health theory and practice; Understanding linkages between Environment and Public Health: Effect of quality of air, water and soil on health. The Bhopal disaster and its aftermath: are views.

Module II: Human Health Exposure Effects
Ecosystems and Human well-being: Synthesis; Human exposure assessment; Introduction to Bio-monitoring and bio-markers; Exposure assessment; Perspective on Individual health: Nutritional, socio-cultural and developmental aspects, Dietary diversity for good health; Human developmental indices for public health.

Module III: Human Health Risks Assessment
Introduction to environmental hazards and their effects on human health and ecosystems; Health effects of chemical exposure. Known's and unknowns on burden of disease due to chemicals: A systematic review; Cancer-Causing Substances in the Environment. Quantifying selected major risks to health: Selected Occupational risks.

CLIMATE CHANGE AND IMPLICATIONS ON PUBLIC HEALTH

Course Code: AST2252 **Credit Units: 03**

Course Objectives: This course intends to educate students about basic principles behind the climate change and public health. Emphasis will be given to how the changes in weather and climate parameters, especially the episodic events influence human health and vice versa.

Course Contents

Module-I: Human Influence on Climate
Global warming- Agricultural practices (chemical agriculture) and Industrial technologies (use of non-biodegradable materials like plastics, aerosols, refrigerants, pesticides); Manifestations of climate change on Public Health-Burning of fossil fuels, automobile emissions and acid rain.

Module-II: Local/ Regional Climate Feedbacks on Human Health
Changes in the greenhouse gas concentrations and other drivers that alter the global climate and bring about myriad human health consequences. Environmental consequences of climate change, such as extreme heat waves, rising sea-levels, changes in precipitation, resulting in flooding and droughts, intense hurricanes, and degraded air quality, affect directly and indirectly the physical, social, and psychological health of humans.

Module-III: Cohort Studies of Weather/ Climate and Health Relationship
Changes in precipitation: availability and quantity of water, underlying extreme weather events such as intense hurricanes and flooding. Climate change: a driver of disease migration, as well as exacerbate health effects resulting from their lease of toxic air pollutants invulnerable populations such as children, the elderly, and those with asthma or cardiovascular disease, Cohort Studies.

DISEASES IN CONTEMPORARY SOCIETY

Course Code: AST2352 **Credit Units: 03**

Course Objectives: This course deals with different types of diseases including communicable ones that are primarily caused by particulate and gaseous pollutants. Several pollutants and corresponding health problems will be delineated. Necessary precautions required to be taken for reducing the health problems will be explained.

Course Contents

Module-I: Health-Susceptibility Relationship
Need for good health-factors affecting health; Types of diseases-deficiency, infection, pollution diseases-allergies, epidemiological, cardiovascular, COPD including non-smokers and cancer; Personal hygiene-food - balanced diet; Food habits and cleanliness; food adulterants, avoiding smoking, drugs and alcohol, Physiology.

Module-II: Biomarkers and Different Diseases
Stem cells and Immune cells, DNA/RNA, Biological Processes, Spirometry, Communicable diseases: Mode of transmission epidemic and endemic diseases; Management of hygiene in public places - Railway stations, Bus stands and other public places; Infectious diseases: Role of sanitation and poverty case studies on TB, diarrhea, malaria, viral diseases. Non-communicable diseases: Role of Life style and built environment; Diabetes and Hypertension.

AIR, WATER AND SOIL POLLUTION, ENVIRONMENTAL HEALTH PROFESSIONS

Course Code: AST2452 **Credit Units: 03**

Course Objectives: This course will provide students with an understanding and appreciation of the complex interactions between microbial air, water and soil quality and human health. The broad objectives of this course cover (i) impact of both primary and secondary (gas-to-particle conversion) particles on morbidity and mortality of human health and pre-mature deaths, (ii) howthequalityofwaterisaffectedbynatural,seasonal,accidental,intentionalandman-madeactivities, (ii) how the contaminated water increases the burden of human diseases with particular emphasis on infectious diseases, (iii) Industrial processes including mining and manufacturing that lead to cause of soil pollution.

Course Contents

Module-I: Interface Between Indoor and Outdoor Pollution
Indoor and outdoor air pollutants; sources and effects of pollutants in the atmospheric environment; Particulate matter and atmospheric visibility; Atmospheric diffusion theories and types of dispersion models; Lapse rates and various types of stability classification; Wind profile; Wind roses; Mixing depth.

Module-II: Air Pollution and Emission Inventory
General characteristics of the stack plumes; Dispersion of pollutants in the atmosphere and solution of advection diffusion equation with Gaussian distribution for point, line and area sources; plume rise; dispersion parameters and various methods of their evaluation; Atmospheric Removal processes and residence time; Effect of buildings and topography on dispersion; Similarity theory and profiles in the surface layer; Air Quality and Emission standards, their measurements and statistics; Air quality and environmental health.

Module-III: Water Pollution and Purification
Understanding of the significance of the environment for human health; Human population pressures and pollution dynamics; Common terms and definitions in water quality; Aquatic resources of the world & Sources of drinking water -Common contaminants of drinking water and linkages to disease; Non-point source pollution.

Module-IV: Soil Pollution-Causes and Mitigation
Soil contamination from abandoned industrial sites; Ants in to the environment, Improper disposal of house hold waste; Garbage and personal waste that leaks from sewer systems; pollution due to aged waste decompose; pollution due to plastic products like water bottles, bags and diapers. Risings use of chemicals in agriculture; toxic soil issues from industries and agricultural activities; contributions from pesticides and fertilizers, Increase in toxicity and reduction in fertility.

GROUND-BASED AND SATELLITE REMOTE SENSING

Course Code: AST2552 **Credit Units: 03**

Course Objectives: The course will make the students aware about various passive and active remote sensing sensors and techniques used now-a-days for observing the weather and climate system. The lectures will focus on the fundamentals of retrievals of various geophysical parameters and interpretation of remote sensing data.

Course Contents

Module-I: Aerial Mapping
Introduction & history to Aerial Photography; vantage points, vertical & oblique aerial photography; Planning; Elements of visual image interpretation; Geometry of aerial photography, photogrammetry; Relief displacement; Stereos copy; Parallax.

Module-II: Multi-Platform Remote Sensing
Definition, history; Electromagnetic radiation, atmospheric windows, atmospheric bands; Orbits sun-synchronous, geo-synchronous; Resolution spectral, spatial, radiometric, temporal; Multispectral & Hyper spectral remote sensing; Satellite remote sensing missions; Active &Passive remote sensing, RADAR, LIDAR; Applications – soil, water, vegetation, air, urban landscape.

Module-III: Geographical Information System (GIS)
Introduction to GIS, Management of data, GIS as DBMS, Data types – vector & raster, Data manipulation and analysis; Components of GIS; Structure of GIS; Digital Elevation Models; Triangulated Irregular Network; GIS applications; Global Positioning System.

INSTRUMENTATION LAB

Course Code: AST2652 **Credit Units: 03**

Course Objectives: This course essentially deals with different experimental methods, data acquisition and retrieval algorithms being used in environmental pollution, Health risks and Climate Change studies. Special emphasis will be given to the students to get familiarized with latest advancements in ground-based and satellite remote sensing techniques.

Course Content

High Volume Sampler; AAS (Atomic Absorption Spectroscopy); ICPMS (Inductively Coupled Plasma Mass Spectrometry); HPLC (High-Performance Liquid Chromatography); GC/IC (Gas and Ion Chromatography),Sun-Sky Radiometers; Real-Time EC-OC Analyzers; RADAR, LIDAR, SODAR and SONAR; Satellite Remote Sensing Techniques.

BASICS OF CLIMATE SCIENCE

Course Code: AST2151 **Credit Units: 03**

Course Objectives:

The aim of this course is to provide the students a basic understanding about the climate system: its attributes, underlying processes, and the drivers of climate change. Knowledge of various components of climatic system, and their interactions with atmosphere/hydrosphere/lithosphere would further create interest amongst the students about the climate system modelling and climatic vulnerability. This course emphasizes the scientific basis for anthropogenic climate change. Students will learn the physics behind the climate system, how climate has changed in the past and reasons why contemporary climate change is different, the scientific basis for anthropogenic climate change theory and how scientists use models to predict future climate. The course will also provide an overview of the physical, ecological, biological, social and economic impacts of climate change. Finally, students will examine various mitigation and adaptation strategies which society can employ in a warmer world.

Course Contents:

Module I: Introduction to Climate Science and its Components

Fundamentals of meteorology; Vertical profiles of temperature, wind, pressure, water vapor, and microphysical processes in the atmosphere; Climate system and interaction among components (atmosphere, oceans, sea, ice and land surface) of climate system and feedback mechanisms; Atmospheric thermodynamics, radiation in the atmosphere, Greenhouse gases and climate forcing; Overview of weather systems: Extreme weather events and Western disturbance.

Module II: Remote Sensing Techniques

Types of remote sensing; Different remote sensing platforms; Principles of Remote Sensing; Radiometer, Lidar, Radar, Sodar, Sonar, Land-atmosphere-ocean satellites; Calibration and validation methods.

Module III: Climatology and Meteorology

Radiation budget and balance; Solar constant; Lapse rate and stability; Water cycle and role in weather; Mechanism of wind development; Fundamental forces (pressure gradient, centrifugal, gravity, Coriolis); Surface winds and upper air circulations; Jet streams; Planetary circulations.

INTRODUCTION TO EARTH SYSTEM SCIENCE

Course Code: AST2251 **Credit Units: 03**

Course Objectives:

This course embraces chemistry, biology, mathematics and applied sciences in transcending disciplinary boundaries to treat the Earth as an integrated system. Thus, it imparts knowledge to the students with basic understanding of the physico-chemical, biological and human interactions that determine the past, current and future states of the Earth. Earth system science seeks to integrate various fields of academic study to understand the Earth as a system. It considers interaction between the atmosphere, hydrosphere, lithosphere, biosphere and heliosphere.

Further, the Earth System Science program provides students with a fundamental understanding of the oceanographic, atmospheric, and terrestrial sciences. This program of study prepares students for careers in science, research, or technical fields. Students learn to apply basic sciences (physics, chemistry, mathematics, and biology) to understand the major processes and systems governing the Earth's climate, biogeochemical cycles, and global change. Central to the B.S. program is an understanding of relevant scientific literature, methods to collect/analyze data, and interpret results in the context of scientific theory. Students will learn to work collaboratively to understand and address complex problems and communicate scientific knowledge. Through the core course work, students will learn to explain the current and projected future state of the Earth system in the context of past climate change and current human activities.

Course Contents:

Module I: Fundamental Processes in Earth and Environmental Studies

An introduction to the physical environment, biological systems, and human-environmental interactions, Physical principles such as fluid transport and reaction rates using environmental examples as well as principles of populations, ecosystems, carrying capacity, and sustainable use of resources.

Module II: Hurricanes, Tsunamis and other Catastrophes

Introduction to the basic science and state of predictability of various natural catastrophic events such as hurricanes, tsunamis and volcanoes, future climate catastrophes including severe droughts, abrupt climate change, thermohaline circulation collapse and sea level rise.

Module III: Remote Sensing and Geographic Information System (GIS) for Earth System Science

Principles behind remote sensing, and the types of satellite data available for study of the oceans, land, and atmosphere, GIS Brief History, Techniques and Technology, Uncertainties, Spatial Analysis.

Syllabus - Semester Third

CLOUD MICROPHYSICS AND CHEMISTRY

Course Code: AST2351 **Credit Units: 03**

Course Objectives:
This course focuses on understanding how transformation of aerosol particles to droplets or ice crystals, heterogeneous chemistry and acid rain, physics of aerosol and cloud element motion, the interaction of particles with water vapor, chemical composition of particles and the effect on cloud formation processes, and the effect of cloud processing on aerosol chemistry, geo-engineering, weather modification and volcanic effects. Thus, it provides the students an insight into one of the important complex drivers of the local/regional/continental/hemispheric/global climate system.

Course Contents

Module I: Basic Cloud Physics
Water vapour and its thermodynamic effects, mixing and convection, formation of cloud droplets, formation and growth of ice crystals, aerosol sources and sizes, condensation and growth of cloud droplets: curvature, Kelvin, solute effects, cloud growth and precipitation, rain, snow and hail processes.

Module II: Microphysical Processes in warm and cold clouds
Cloud condensation nuclei, microstructures of warm clouds, growth of cloud droplets in warm clouds, growth by condensation and collision-coalescence, microphysics of cold clouds, growth by collection, modification of warm and cold clouds, lightning and thunder.

Module III: Cloud and Precipitation Chemistry
Transport of particles and gases, nucleation scavenging, dissolution of gases in clouds droplets, precipitation scavenging, chemical composition of rain, production of aerosols by clouds.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	15	5	5	70

A-Attendance; CT-Class Test; S/V/Q-Seminar/Quiz/Viva; HA-Home Assignment; EE-End Semester Examination

Syllabus - Semester Fourth

CLIMATE CHANGE: IMPACT, VULNERABILITY AND ADAPTATION

Course Code: AST2451 **Credit Units: 03**

Course Objectives:
This course provides the students with an introduction to the vulnerability of climate change and potential adaptation options of natural as well as social systems. A critical view will be laid on the 'attribution problem', the prioritization of adaptation means, mal-adaptations, the implementation problem, ethical views and conflicts with development goals. Win-win-situations and trade-offs between the latter and climate change adaptation is part of this course too.

Course Contents

Module I: Introduction to the Impacts of Climate Change
Fundamentals of climate system and climate change, brief summary of Inter-Governmental Panel of Climate and Climate Change (IPCC) reports, future directions for mitigation processes.

Module II: Vulnerability
Introduction to the concept, ecological and social systems, coastal vulnerability, methods of evaluation of vulnerability and impacts.

Module III: Adaptation
Introduction to the concept, indicators of adaptation, options and limits of adaptation, food and energy security, autonomous versus planned adaptation, adaptation capacity.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	15	5	5	70

A-Attendance; CT-Class Test; S/V/Q-Seminar/Quiz/Viva; HA-Home Assignment; EE-End Semester Examination

Syllabus - Semester Fifth

PRIMER OF OCEANOGRAPHY

Course Code: AST2551 **Credit Units: 03**

Course Objectives:
Ocean-related science is relevant to many contemporary environmental issues and problems and central to understanding earth-system evolution, dynamics, climate and sustainability. This course offers a very flexible curriculum that serves students with a broad range of educational and career interests including environmental management and regulation, environmental law. The topics selected for this course, are expected to provide the students with a broad conception of the world's oceans; evaluation of its potential contributions to solution of problems presently confronting mankind.

Course Contents
Module I: Ocean Properties
Introduction to Oceans, physical and chemical properties of ocean water, composition of sea water, salinity and density.
Module II: Physical Oceanography
Thermal expansion of sea water, viscosity, surface tension, heat conduction, adiabatic temperature changes, optical properties, temperature-salinity relationship,
Module III: Bathymetry, Eco Systems and Pollution
Basic definition, oceanic life and ecosystems, measurement techniques, bathymetric chart, fish-zone detection, marine pollution.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	15	5	5	70

A-Attendance; CT-Class Test; S/V/Q-Seminar/Quiz/Viva; HA-Home Assignment; EE-End Semester Examination

Syllabus - Semester Sixth

FUNDAMENTALS OF CLIMATE VARIABILITY AND MODELLING

Course Code: AST2651 **Credit Units: 03**

Course Objectives:
This course essentially deals with fundamentals of climate variability and its modelling. This knowledge to the students makes them familiar with different types of climate models available not only for prediction purposes but also to undertake sensitivity tests and to simulate the future climate scenarios both regionally and globally.

Course Details

Module I: Climate Variability
Natural variability versus anthropogenic forcing to climate system, climate sensitivity, Greenhouse gases and global warming,

Module II: Climate Drivers
Climate Global distributions of temperature, precipitation, precipitation, climate classification, Natural and external forcings to climate variability,

Module III: Basics of Climate Modelling
Simple energy balance climate models, introduction to coupled ocean-atmosphere models, simple models for predicting climate change and impact assessment.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	15	5	5	70

A-Attendance; CT-Class Test; S/V/Q-Seminar/Quiz/Viva; HA-Home Assignment; EE-End Semester Examination

SUSTAINABILITY SCIENCE

PROGRAMME OUTCOMES

The under-graduates will be able to

PO 1. Grasp the foundational principles of sustainability, including ecological, economic, and social dimensions. Understand global and local sustainability challenges and how they intersect with environmental, economic, and social systems.

PO 2. Develop the ability to critically analyze sustainability problems using multidisciplinary approaches. Apply systems thinking to assess the long-term impacts of various environmental and societal actions.

PO 3. Recognize and evaluate the ethical implications of sustainability practices and policies. Demonstrate a commitment to promoting sustainable practices in professional and personal contexts.

PO 4. Communicate effectively with diverse audiences about sustainability issues, using appropriate tools and techniques. Lead and collaborate on projects aimed at promoting sustainable solutions in communities and organizations.

PO 5. Conduct sustainability research using appropriate methods and techniques. Develop innovative solutions to sustainability challenges through creative thinking and technological application.

PROGRAMME SPECIFIC OUTCOMES

PSO1. Apply principles of environmental science to manage natural resources sustainably. Develop and implement strategies for minimizing human impact on ecosystems and biodiversity.

PSO2. Design and evaluate development projects that balance economic growth with environmental stewardship and social equity. Analyze and promote policies that support sustainable urban and rural development.

PSO3. Understand the science and impacts of climate change and develop strategies to mitigate and adapt to its effects. Implement and assess climate action plans and policies at local, regional, and global levels.

PSO4. Integrate sustainability into business models and operations, emphasizing corporate social responsibility and ethical decision-making. Evaluate and improve the sustainability performance of businesses using various metrics and frameworks.

PSO5. Optimize the use of energy and resources to reduce environmental impact and enhance economic viability. Promote the adoption of renewable energy sources and energy-efficient technologies.

FIRST SEMESTER (Major and Minor)

DESC2153	FUNDAMENTALS OF SUSTAINABILITY	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The "Fundamentals of Sustainability Science" course is to introduce students to the core principles and concepts of sustainability, emphasizing the interconnectedness of environmental, social, and economic systems. Students will explore the historical context of sustainability, key theories, and the scientific basis for sustainable practices. The course aims to foster an understanding of the challenges and opportunities associated with sustainability, encouraging critical thinking about resource management, ecosystem health, and human well-being.

Course Objectives

Objectives include analyzing case studies that illustrate successful sustainability initiatives, as well as understanding the role of policy and governance in promoting sustainable development. Additionally, the course seeks to equip students with practical skills in sustainability assessment and evaluation techniques. Ultimately, the course aims to inspire a commitment to sustainable practices and empower students to contribute to positive change in their communities and professions.

Course Outcomes

1. **CO1. Conceptual Understanding:** Students will demonstrate a comprehensive understanding of key principles, concepts, and historical contexts of sustainability science.
2. **CO2. Critical Analysis:** Students will critically analyze the interconnections between environmental, social, and economic systems and their implications for sustainable development.
3. **CO3 Sustainability Assessment:** Students will apply sustainability assessment tools and metrics to evaluate the effectiveness of sustainability initiatives and practices.
4. **CO4. Case Study Evaluation:** Students will assess real-world case studies, identifying best practices and lessons learned in sustainability implementation.
5. **CO5. Policy and Governance Insight:** Students will understand the role of policy and governance in promoting sustainability, enabling them to engage in informed discussions and decision-making processes.

SECOND SEMESTER (Major and Minor)

DESC2253	**ECOSYSTEM & NATURAL CAPITAL**	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The course on Ecosystem and Natural Capital aims to provide students with a comprehensive understanding of the relationships between ecosystems and economic systems. It explores the value of natural resources and ecosystem services, emphasizing their role in sustaining human well-being and economic development. Through a combination of theoretical concepts and practical case studies, students will learn to assess the impacts of human activities on ecosystems, develop strategies for sustainable management, and advocate for policies that integrate ecological health with economic growth, ultimately fostering a deeper appreciation for the intrinsic value of nature in decision-making processes.

Course Objectives

The course on Ecosystem and Natural Capital aims to equip students with an understanding of the interplay between ecosystems and economic systems. It focuses on recognizing the value of natural resources and ecosystem services, highlighting their importance for human well-being and sustainability. Students will learn to assess ecological impacts, explore sustainable management practices, and develop policies that integrate environmental health with economic development, fostering a holistic approach to natural capital preservation and responsible resource use.

Course Outcomes

1. CO1. Understanding Ecosystem Services: Students will be able to identify and categorize various ecosystem services and articulate their significance for human well-being and economic development.
2. CO2. Impact Assessment: Students will develop skills to assess the environmental and economic impacts of human activities on ecosystems, using relevant tools and methodologies.
3. CO3. Sustainable Management Strategies: Students will be able to propose and evaluate sustainable management strategies that balance ecological integrity with economic needs.
4. CO4 Policy Development: Students will learn to design and advocate for policies that promote the integration of ecosystem health into economic decision-making processes.
5. CO5. Critical Analysis: Students will be equipped to critically analyze case studies related to natural capital, enabling them to understand complex interactions between ecosystems and socio-economic factors.

THIRD SEMESTER (Major and Minor)

DESC2353	ECOLOGICAL ECONOMICS	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

This subject introduces students to the fundamentals of environmental economics. It covers some basic concepts of economics to familiarize students with absence of market, demand and supply in nature. Each unit covers a range of topics, which will help students develop modern concepts of environmental economics and its importance in conservation of biodiversity and ecosystems through understanding of economic costs associated with these.

Course Objectives

The course objectives of Ecological Economics include understanding the interconnections between ecological systems and economic activities, evaluating the sustainability of resource use, and analyzing the impacts of human behavior on the environment. Students will explore concepts such as ecosystem services, the value of biodiversity, and the principles of sustainable development. The course aims to equip learners with the tools to assess environmental policies, promote equitable resource distribution, and develop innovative solutions that balance economic growth with ecological integrity.

Course Outcomes

1. CO1. Critical Analysis: Students will be able to critically analyze the relationships between economic systems and ecological processes, identifying key sustainability challenges.
2. CO2. Valuation of Ecosystem Services: Learners will demonstrate the ability to assess and articulate the value of ecosystem services and their role in economic decision-making.
3. CO3. Policy Development: Students will be equipped to design and evaluate policies that promote sustainable resource management and address environmental justice.
4. CO4. Interdisciplinary Integration: Participants will integrate knowledge from economics, ecology, and social sciences to propose holistic solutions for environmental issues.
5. CO5. Systems Thinking: Students will apply systems thinking to understand complex ecological-economic interactions and develop strategies for long-term sustainability.

FOURTH SEMESTER (Major and Minor)

DESC2453	SUSTAINABILITY: INSTITUTIONS & GOVERNANCE	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The course aims to equip students with the skills to critically evaluate existing governance frameworks and develop innovative solutions for sustainability issues. Through case studies and collaborative projects, participants will engage in hands-on learning, fostering the ability to navigate complex social-ecological systems and contribute effectively to sustainable governance initiatives.

Course Objectives

The objective of the Sustainability: Institutions & Governance course is to explore the role of various institutions in shaping sustainable practices and policies. Students will analyze how governance structures, both formal and informal, influence decision-making processes and resource management at local, national, and global levels. By understanding these dynamics, learners will gain insights into the challenges and opportunities for promoting sustainability within different contexts.

Course Outcomes

1. **CO1. Critical Analysis Skills**: Students will be able to critically assess various governance frameworks and their effectiveness in promoting sustainability across different contexts.
2. **CO2. Interdisciplinary Understanding**: Learners will develop a comprehensive understanding of the interplay between social, economic, and environmental systems in sustainability governance.
3. **CO3. Policy Development**: Students will acquire the skills to design and propose effective policies that address sustainability challenges, considering institutional and stakeholder dynamics.
4. **CO4. Collaborative Engagement**: Participants will be able to engage collaboratively with diverse stakeholders, fostering partnerships that support sustainable development initiatives.
5. **CO5. Practical Application**: Learners will apply theoretical concepts to real-world scenarios through case studies, enhancing their ability to address complex sustainability issues in various governance settings.

FIFTH SEMESTER (Major & Minor Course)

DESC2553	**ENVIRONMENT & SOCIAL GOVERNANCE (ESG)**	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The ESG course is designed to help learners understand and evaluate the sustainability and ethical impact of businesses and organizations. Through this comprehensive short course, you'll gain fundamental knowledge of ESG, learn how to embed ESG into business operations and strategy, and understand how to communicate the importance of ESG effectively to different stakeholders.

Course Objectives

The course on Environment & Social Governance (ESG) aims to equip students with a comprehensive understanding of ESG principles and their significance in sustainable business practices. Objectives include analyzing the impact of environmental, social, and governance factors on corporate performance; assessing ESG risks and opportunities; exploring regulatory frameworks and reporting standards; and developing strategies for effective ESG integration.

Course Outcomes

1. **CO1.Understanding ESG Frameworks**: Students will be able to articulate key ESG principles and frameworks, including their relevance to corporate governance and sustainability.
2. **CO2. Risk Assessment Skills**: Participants will develop the ability to assess and analyze ESG-related risks and opportunities, informing strategic decision-making.
3. **CO3. Regulatory Knowledge**: Students will gain insights into global ESG regulations and reporting standards, enabling them to navigate compliance effectively.
4. **CO4. Stakeholder Engagement**: Participants will learn techniques for engaging with stakeholders on ESG issues, fostering transparency and collaboration.
5. **CO5. Implementation Strategies**: Students will design actionable strategies for integrating ESG considerations into organizational practices, enhancing overall sustainability and ethical impact.

Course Content

Modules	**Bloom's level***	**Number of hours**
Module I: **Introduction to ESG:** Define ESG, Approaches to SG, Sustainable investment, green investment, benefits and challenges of incorporating ESG in decision making, Environmental, social, governance factors for ESG, Institutional demand for ESG	**L1, L2, L3, L4**	**20**

Prof. (Dr.) Anil Kumar

FIFTH SEMESTER (Major)

DESC2503	**APPROACHES TO SUSTAINABILITY**	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The course emphasizes the importance of interdisciplinary collaboration in sustainability efforts. Through practical case studies and group projects, students will develop the skills needed to apply theoretical concepts to real-world situations, fostering innovative solutions that promote long-term sustainability across various sectors and communities.

Course Objectives

The objective of the Approaches to Sustainability course is to introduce students to various frameworks and methodologies for achieving sustainable development. By exploring ecological, economic, and social dimensions, learners will understand how different approaches can be integrated to address pressing sustainability challenges. This foundational knowledge will empower students to critically evaluate existing strategies and identify best practices.

Course Outcomes

1. **CO1. Comprehensive Understanding**: Students will demonstrate a thorough understanding of various sustainability frameworks and approaches, evaluating their applicability in different contexts.
2. **CO2. Critical Thinking**: Learners will develop critical thinking skills to analyze and assess the effectiveness of existing sustainability strategies and policies.
3. **CO3. Interdisciplinary Application**: Participants will be able to integrate knowledge from multiple disciplines to design comprehensive sustainability solutions for complex problems.
4. **CO4. Practical Problem-Solving**: Students will apply theoretical concepts to real-world scenarios, developing innovative strategies that address sustainability challenges.
5. **CO5. Collaborative Skills**: Learners will cultivate teamwork and communication skills necessary for engaging with diverse stakeholders in sustainability initiatives.

Course Content

Modules	**Bloom's level***	**Number of hours**
Module I: Environment in an urban setting Introduction to urbanization; commodification of nature; metros, cities and towns as sources and sinks of resources; resource consumption and its social, cultural, economic and ecological perspectives; increasing challenges posed by modernity for the environment; urban pollution (air, water, soil).	**L1, L2, L3, L4**	**20**

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

Sixth Semester (Major and Minor)

DESC2653	SUSTAINABILITY: A CASE STUDY	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

It aims to provide an idea of effective management strategies and a critical insight of the major sustainability issues. Students will identify and propose innovative solutions to real-world issues, while also examining the role of policies and strategies in shaping sustainable outcomes. Ultimately, the course seeks to equip participants with practical insights that can inform future sustainability initiatives.

Course Objectives

The course "Sustainability: A Case Study" aims to provide students with a deep understanding of sustainability practices through the analysis of specific case studies. Objectives include conducting in-depth evaluations of successful sustainability initiatives across various sectors, fostering critical thinking skills to assess their effectiveness, and exploring multi-disciplinary perspectives on sustainability challenges.

Course Outcomes

1. **CO1.Case Analysis**: Analyze specific case studies to identify key sustainability practices and their outcomes across different sectors.
2. **CO2. Critical Evaluation**: Develop critical evaluation skills to assess the effectiveness and impact of sustainability initiatives in real-world contexts.
3. **CO3. Interdisciplinary Insights**: Explore sustainability issues through interdisciplinary lenses, integrating concepts from environmental science, economics, and social equity.
4. **CO4. Innovative Solutions**: Identify and propose innovative, practical solutions to sustainability challenges presented in case studies.
5. **CO5. Policy Assessment**: Evaluate the influence of policies and strategies on sustainability outcomes, learning from successful case study implementations to inform future practices.

Course Content

Modules	Bloom's level*	Number of hours
Module I: **Various Approaches to Sustainability Science**: Status Quo Approach, Community Capacity Building Approach, Industrial Sector Approach, Integrated Systems Approach, Human Development Approach, Green Accounts Approach	**L1, L2, L3, L4**	**20**

SIXTH SEMESTER (Major)

DESC2605	CLIMATE CHANGE: ADAPTATION & RESILIENCE	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

The course on "Climate Change: Adaptation & Resilience" aims to equip students with a comprehensive understanding of the challenges posed by climate change and the strategies for adaptation and resilience. The course emphasizes the importance of interdisciplinary approaches, integrating insights from environmental science, social sciences, and policy studies to develop holistic solutions.

Course Objectives

Objectives include analyzing the impacts of climate change on various ecosystems, communities, and economies, fostering a deep awareness of vulnerability and risk. Students will explore different adaptation strategies that can be implemented at local, national, and global levels, examining case studies that highlight successful resilience initiatives.

Course Outcomes

1. **CO1. Impact Assessment:** Students will be able to analyze the impacts of climate change on ecosystems, communities, and economies, identifying key vulnerabilities**.**
2. **CO2. Adaptation Strategies:** Participants will develop and propose effective adaptation strategies that enhance resilience at local, national, and global levels.
3. **CO3. Interdisciplinary Approach:** Students will demonstrate the ability to integrate knowledge from environmental science, social sciences, and policy studies to create holistic solutions.
4. **CO4. Stakeholder Engagement:** Participants will effectively engage with stakeholders to assess needs and priorities for adaptation measures, ensuring inclusive decision-making.
5. **CO5. Innovative Solutions:** Students will apply critical thinking and problem-solving skills to design innovative resilience initiatives that address current and future climate challenge.

Course Content

Modules	Bloom's level*	Number of hours
Module I: **Introduction; Key Terms and Concepts**: The Meaning of Adaptation , The Ethics of Adaptation, Climate Change Impacts and Risks, Climate Change Vulnerability, Vulnerability Analysis, Dimensions of Resilience, Ecological Resilience, Adaptive Capacity, Adaptation Pathways, Transitions and Transformation	**L1, L2, L3, L4**	**20**

SIXTH SEMESTER (Major)

DSC2604	SUSTAINABILITY REPORTING	L	T	P	C
Version 1.1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure					
Co-requisites					

Course Catalogue

Sustainability reporting course is designed to equip students with the knowledge and skills necessary to understand, develop, and analyze sustainability reports. Students will learn to assess the environmental, social, and governance (ESG) performance of organizations and effectively communicate these findings to stakeholders.

Course Objectives

The course emphasizes the importance of transparency and accountability in sustainability practices, encouraging critical thinking about how these principles can drive ethical decision-making and enhance stakeholder trust. By exploring real-world examples, students will be prepared to contribute effectively to responsible business operations and advocate for sustainable development within organizations.

Course Outcomes

1. **CO1. Report Creation:** Students will be able to develop comprehensive sustainability reports that adhere to recognized frameworks and standards.
2. **CO2. Performance Assessment:** Participants will evaluate organizational performance in terms of environmental, social, and governance (ESG) metrics.
3. **CO3. Critical Analysis:** Students will critically analyze existing sustainability reports, identifying strengths, weaknesses, and areas for improvement.
4. **CO3. Stakeholder Communication:** Participants will effectively communicate sustainability information to various stakeholders, enhancing transparency and engagement.
5. **CO4. Ethical Decision-Making:** Students will understand the role of ethics in sustainability reporting, applying principles of accountability and transparency to promote responsible business practices**.**

Course Content

Modules	Bloom's level*	Number of hours
Module I: Environmental economics, characteristics of environmental goods; marginal analysis; markets and market failure; social benefit, costs and welfare functions; meaning and types of environmental values; measures of economic values; tangible and intangible benefits; Pareto principle or criterion; Hardin's Thesis of 'The Tragedy of Commons'; prisoner's dilemma game; methods of abatement of externalities; social cost benefit analysis; cost-effectiveness analysis.	**L1, L2, L3, L4**	**20**

Bachelor of Science (Honors/ Honors with Research) in Biotechnology

About the Program

The BSc Biotechnology program aims to provide students with a comprehensive understanding of the principles and applications of biotechnology. It integrates knowledge from biology, chemistry, and technology to explore and manipulate living organisms for the benefit of society. The program's goals include equipping students with practical laboratory skills, a deep understanding of molecular biology, genetic engineering, bioprocess technology, and bioinformatics. Graduates will be prepared for careers in healthcare, agriculture, environmental conservation, and industrial biotechnology, as well as for advanced studies and research.

Aligned with India's National Education Policy (NEP), the program emphasizes multidisciplinary and holistic education, fostering critical thinking, creativity, and problem-solving skills. It includes experiential learning through internships and industry collaborations, promotes research and innovation, and supports the development of ethical and responsible biotechnological practices. The curriculum is designed to be flexible, enabling students to choose electives and pursue interests across various domains, thereby creating a well-rounded educational experience. This alignment ensures that the program remains relevant, dynamic, and responsive to

The table below states Amity University Haryana's key objectives, Amity Institute of Biotechnology's Objectives for the UG program (Program Objectives, PO) and the Program Specific Objectives, PSO, for the BSc Biotechnology program, all in line with the NEP. The POs and PSOs form the foundation principles based on which the program structure and the curriculum for each course is designed. The course content for each course is duly mapped to the POs and PSOs.

	AUH Key Objectives (based on NEP)	AIB Objectives (PO)	BSc BT objectives (PSO)
1	Multidisciplinary Learning and Holistic Education	To impart a comprehensive understanding of core subjects in Life Sciences along with a strong foundation in allied disciplines such as chemistry, physics, and computational and mathematical tools.	To impart a comprehensive understanding of core subjects in Biotechnology along with a strong foundation in allied disciplines such as chemistry, physics, and computational and mathematical tools.
2	Experiential and Hands-on Learning	To empower the students with the technical knowledge and skills for executing experiments in Life Sciences, with focus on experimental design, use of modern experimental equipment, qualitative and quantitative data collection, critical thinking and analysis, in order to make them skilled for career opportunities.	To empower the students with the technical knowledge and skills for executing experiments in Biotechnology, with focus on Experimental Design, use of modern experimental equipment, qualitative and quantitative data collection, Critical Thinking and analysis, in order to make them skilled for career opportunities.
3	Research and Innovation	To inculcate a spirit of scholarly research, innovation and entrepreneurship in Life Sciences	To inculcate a spirit of scholarly research, innovation and entrepreneurship in Life Sciences
4	Ethics and Sustainability	To instil ethical practices and an understanding of sustainable development in the context of issues related to Life Sciences	To instil ethical practices and an understanding of sustainable development in the context of issues related to Life Sciences

5	Communication and Collaboration	To improve scientific communication skills through various medias, and the ability to work collaboratively in multidisciplinary teams	To improve scientific communication skills through various medias, and the ability to work collaboratively in multidisciplinary teams
6	Lifelong Learning and Adaptability	To nurture a mindset of continuous education and professional development, by encouraging a quest for knowledge and personal growth.	To nurture a mindset of continuous education and professional development, by encouraging a quest for knowledge and personal growth.

A salient feature of the NEP is the emphasis on providing the students opportunities for multidisciplinary learning, practical real-life experience, and a all-rounded personal development. This is implemented through offering various baskets of courses as follows. Students will learn the subjects in their chosen major through the basket of courses offered under Discipline Specific Courses (DSC I). In addition, two more baskets of courses DSC-II and DSC-III (often referred to as D2 and D3 courses respectively). The D2 basket includes courses that are offered by a program different from the one the student has registered as the Major program but within the same Faculty. The D3 basket includes courses that are offered by a program different from the one the student has registered as the Major program and outside the Faculty. (Amity University Haryana has the following 6 Faculties: 1. Faculty of Science Engineering and Technology, 2. Faculty of Health and Allied Sciences, 3. Faculty of Arts, 4. Faculty of Management Studies & Behavioural Sciences, 5. Faculty of Architecture and Planning, and 6. Faculty of Law. Amity Institute of Biotechnology comes under the Faculty of Science Engineering and Technology).

In addition, the Skill Enhancement courses, Ability Enhancement courses and Value Added courses further diversify the scope of student's learning in order to empower them for a wholistic development.

Course Code: DBTH2101	PLANT AND ANIMAL DIVERSITY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**Plant and Animal Diversity Lab**				

Catalog Description

This course explores the vast diversity of plant and animal life through Whittaker's five-kingdom system, highlighting the importance of biodiversity and its conservation with case studies. Students will learn about plant and animal classification, evolutionary relationships, and the use of model organisms in research. Key topics include cryptograms and phanerogams, invertebrates, and vertebrates, focusing on their characteristics, reproductive structures, and economic importance. The course also addresses threats to biodiversity and conservation strategies.

Course Objectives

This course aims to provide a comprehensive understanding of Whittaker's five-kingdom classification system, the significance of biodiversity and its conservation, and the diverse classifications and evolutionary relationships among plants and animals. Students will explore cryptograms and phanerogams, invertebrates, and vertebrates, focusing on their characteristics, reproductive structures, and economic importance. The course also addresses the threats to biodiversity and various conservation strategies to mitigate these impacts.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Discuss the magnitude of Biodiversity, current challenges to Biodiversity, and advocate the importance of conservation of Biodiversity
- Explain the basis of Whittaker's five-kingdom system of classification, species concept and scientific nomenclature
- Discuss the significance of model organisms representing diverse taxa in biological research
- Expound the vegetative (/somatic) & reproductive characteristics and classification of Plant (cryptogams & phanerogams) and Animal kingdoms (invertebrates & vertebrates) using specific families as examples. Also, explain their economic importance.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction: • Introduction to Whittaker's five-kingdom system of classification • Why study of Biodiversity and Biodiversity conservation is important? (with case study examples)	**L1, L2, L3**	4
Module II: • Overview of plant & animal diversity & classification • Concept of species, binomial nomenclature • Evolutionary relationship among the different domains of life • Model plants and animals as research tool.	**L1, L2, L3**	4

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module III: Plant Kingdom - Cryptograms: • Classification (Based on classical and molecular concepts) • Occurrence, types of cell structure, thallus organization • Mode of reproduction in Algae, Fungi, Bryophytes & Pteridophytes; alternation of generation, life cycles • Transient role of heterospory • Economic importance	**L1, L2, L3**	8
Module IV: Plant Kingdom - Phanerogams: • General classification, characteristics, affinities • Development of reproductive structures of Gymnosperm and Angiosperm with salient features of family: *Cucurbitaceae Apiaceae, Apocynaceae, Asclepiadaceae, Lamiaceae, Euphorbiaceae, and Poaceae* • Economic importance	**L1, L2, L3**	8
Module V: Animal Kingdom - Invertebrates: • General characteristics of Protozoa, Porifera, Coelenterates, Helminths, Annelida, Arthropoda, Mollusca, Echinodermata, classification up to classes. (with the following examples: Amoeba, Sycon, Sponges, Hydra, Tapeworm, Earth worm, Cockroach, & Starfish.)	**L1, L2, L3**	8
Module VI: Vertebrates: • General characters and classification of Chordata, taxonomic position of Protochordates, Urochordates, Cephalochordates & Cyclostomes • Fishes, Amphibians, Reptiles, Birds, Mammals; Parental care in Amphibian, Reptiles, Aves and Mammals. • Homeostasis and Thermoregulation in invertebrates and vertebrates.	**L1, L2, L3**	8
Module VII: Brief overview of Threats to Biodiversity and conservation strategies • Impact of Habitat loss and fragmentation, Invasive species, Pollution and climate change, Monoculture, Role of Biotechnology in promoting monoculture • Conservation strategies	**L1, L2, L3**	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2102	PLANT AND ANIMAL DIVERSITY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**Plant and Animal Diversity Lab**				

Catalog Description

The "Plant and Animal Diversity Lab" course provides hands-on experience with a variety of biological specimens. Modules cover microscopic studies of cryptogams, preparation and identification of gymnosperms and angiosperms, and spot identifications of key animal structures. Students will observe the branchial system, air sacs, and reproductive systems in animals through demonstrations. The course also includes field studies exploring plant and animal diversity on the AUH campus, integrating practical skills with theoretical knowledge.

Course Objectives

The "Plant and Animal Diversity Lab" course aims to provide students with practical skills in microscopic study and preparation of cryptogams, identification and classification of phanerogams, and spot identifications of key animal structures. Through hands-on demonstrations and field studies on the AUH campus, students will explore plant and animal diversity, enhancing their understanding of biological systems and the economic importance of various plant families.

Course Outcomes (COs):

The following skills should be retained by the end of the course:

- Prepare and analyze temporary and permanent microscopic slides of algae, fungi, bryophytes, mosses, lichens, mycorrhiza, and pteridophytes to understand their structure and reproductive features.
- Be proficient in preparing sections of gymnosperms like Cycas and Pinus, as well as in identifying, describing, and characterizing the floral structures and economic importance of locally available angiosperms.
- Identify and describe the anatomical features of various specimens including the earthworm gizzard and intestine, *Amphioxus, Balanoglossus, fish scales, Scoliodon, Trygon*, and *Exocoetus*.
- Identify and explain the functional anatomy of the branchial system of Scoliodon, the air sacs of Columba, and the reproductive systems of male and female Rattus through detailed demonstrations.
- Apply their theoretical knowledge in practical settings by exploring and documenting the diversity of plants and animals on the AUH campus, enhancing their observational and identification skills in a natural environment.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Cryptogams: • Microscopic study Algae of Chlamydomonas, *Volvox, Spirogyra*, (Fresh preparations and permanent slides). • Temporary microscopic slide preparation of Fungi, Bryophytes, Mosses, Lichens, Mycorrhiza, Pteridophytes	L1, L2, L3, L4	6

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

Manesar Gurgaon-122413

Module II: Phanerogams: • Study of the Gymnosperms like *Cycas, Pinus* with the help of permanent slides and by cutting sections and making suitable temporary preparations. • Angiosperm detailed description and identification and floral characterization and economic importance of locally available plants of the families as prescribed in theory course.	L1, L2, L3, L4	6
Module III: Spot Identifications: • Earthworm gizzard and intestine, • *Amphioxus, Balanoglossus,* Fish scales, *Scoliodon, Trygon, Exocoetus*	L3, L4	6
Module IV: Demonstrations: • Branchial system of *Scoliodon*, • Air sacs of *Columba*, • Reproductive system of male and female *Rattus*	L1, L2, L3	6
Module V: Field Study • Exploring Plant Diversity on AUH campus • Exploring Animal Diversity on AUH campus	L3, L5, L6	2

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2103	PLANT AND ANIMAL PHYSIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**PLANT AND ANIMAL PHYSIOLOGY LAB**				

Catalog Description

Studying plant and animal physiology as part of a bachelor's degree can be both fascinating and foundational for understanding how living organisms function. The students will learn how plants convert light energy into chemical energy (glucose) and oxygen and will also learn about the fundamentals of plant-water relationship. In the animal physiology domain students will learn how animals acquire nutrients from food. They will also learn about the basics of cardiovascular system, the physiology of muscle contraction and how animals coordinate responses to stimuli through nervous impulses.

Course Objectives

The main objective of this course is to provide the knowledge about plant & animal physiology. This course will provide a robust foundation in biological sciences and the knowledge can be utilized for understanding real-world applications and current research in plant and animal physiology.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall fundamental plant and animal physiology processes.
- Identify the cellular mechanisms involved in the growth, development, and function of plants and animals.
- Illustrate the biochemical processes underlying the physiological functions in both plants and animals.
- Describe the process of energy acquisition, storage, and utilization processes in plants and animals, including photosynthesis, circulation, and digestion
- Correlate the structure of cells, tissues, organs, and systems with their physiological functions in both plants and animals.
- Analyse physiological processes and solve problems related to plant and animal physiology.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Plant water relationship, growth, and development Water Potential and its components, water absorption by roots, aquaporins, pathway of water movement, symplast, apoplast, transmembrane pathways, root pressure, guttation. Ascent of sap–cohesion-tension theory. Transpiration and factors affecting transpiration, antitranspirants, mechanism of stomatal movement. Phloem as the site of sugar translocation. Ion and solute transport. Mineral nutrition and deficiency. Plant growth regulators. Photoperiodism, flowering stimulus, florigen concept, vernalization, seed dormancy, phytochrome.	L1, L2, L3	8
Module II: Photosynthesis Discovery, photochemical reaction, LHCs, Photosystem, structure of chloroplast, pigments system, photophosphorylation, and carbon fixation pathways: C3, C4	L1, L2, L3, L4	7

Pre-requisites	Nil				
Co-requisites	**PLANT AND ANIMAL PHYSIOLOGY**				

Catalog Description

The course shall provide an understanding of the different physiological processes of plant and animal system in relation to its environment. Students will learn systematic planning and execution of different experiments to remember different concepts of plant water relation, growth and photosynthesis and animal systems.

Course Objectives

The main objective of this laboratory work is to introduce different tools to execute basic experiments of animal & plant physiology formulate and test hypotheses. Process and analyze observation data to present appropriate results. This will also provide students with the opportunity to prepare a research report**.**

Course Outcomes (COs):

On completion of this course, students should be able to:

- Independently carry out experiments in plant physiology to study transpiration, water transport and effect of hormones on plant development, analyse and interpret the experimental outcome.
- Apply thin-layer chromatography to separate natural products (e.g. photosynthetic pigments) from plants.
- Identify different types of blood cells, and enumerate the different cell types using appropriate techniques.
- Practically examine the effect of pH on enzyme activity (e.g. amylase)
- Conduct biochemical analyses of carbohydrates, proteins, and fats to explore the nutritional content and metabolic pathways in organisms.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Plant Physiology Structure of Stomata, Stomatal index and Palisade Ratio	L1, L2, L3	3
Module II: Plant Physiology To study plasmolysis, Ascent of sap, Osmosis & Imbibition pressure	L1, L2, L3	5
Module III: Plant Physiology Effects of plant growth hormones on rooting and shooting	L3, L4, L5	3
Module IV: Plant Physiology Separation of photosynthetic pigments through thin layer chromatography and estimation of different pigments in plants available locally	L1, L2, L3	4
Module V: Animal Physiology Enumeration of red blood cells using hemocytometer	L1, L2, L3	2
Module VI: Animal Physiology Enumeration of total and differential count of white blood cells	L1, L2, L3	4
Module VII: Animal Physiology Effect of pH on amylase activity from saliva	L1, L2, L3	4
Module VIII: Animal Physiology Biochemical analysis: carbohydrate, proteins and fats	L1, L2, L3	5

SEMESTER-II

Course Code: DBTH2201	MICROBIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Biology				
Co-requisites	**DBTH2202 MICROBIOLOGY LAB**				

Catalog Description

Microbiology is aimed at introducing the world of microorganisms, including bacteria, viruses, fungi, and protozoa. This course covers the fundamental principles of microbiology, emphasizing microbial structure, function, metabolism, genetics, growth, control of microorganisms and ecology. Beginners of the course are rightly exposed to the foundation of microbiology, which would lead them towards progressive advancement of the subject as well as their applications in biotechnology and industry.

Course Objectives

To acquaint the students about the basics of microbiology, various techniques for their cultivation and control, and role of various microorganisms in different biotechnological applications.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall the landmark discoveries in Microbiology, and explain the different classifications of microorganisms
- Explain the evolutionary relationship between different microorganisms, and its significance in microbial taxonomy.
- Describe the key metabolic pathways in microorganisms; illustrate their significance in determining the nutrient requirement and growth of microorganisms.
- Explain the principles of microbial genetics and central dogma in microorganisms; illustrate the principles of positive and negative regulation of gene expression.
- Recognise the impact of microorganisms in ecological balance.
- Enlist and explain the ever-increasing list of applications of microorganisms in biotechnology agriculture, food production, and bioremediation.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Microbiology Historical developments of microbiology scope of microbiology, Brief account of organization and classification of microorganisms. Differences between prokaryotic and eukaryotic cell. Overview of bacterial cell structure, (size, shape, arrangement membrane, cell wall, cytoplasmic inclusions, mesosomes, flagella and motility, slime, capsule, pili, chemotaxis, endospore) The brief account of fungi, structure, physiology and classification,brief account of virus (bacteriophages) structure, life cycle (lytic and lysogenic)	L1, L2	6
Module II: Evolutionary microbiology and microbial diversity Microbial evolution and systematics, prokaryotic diversity: bacteria and archea, eukaryotic microorganisms (structure of algae and fungi), microbial community analysis (overview), classical and molecular taxonomy. Virology: Viruses and	L1, L2	6

Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

virions, growth and quantification, viral replication, viroids and prions, Bacterial, plant and animal viruses		
Module III: Reproduction and Growth Life cycles of representative microorganisms including bacteria, fungi and viruses, population growth and its measurement, effect of environmental condition on growth pH, temp. aeration etc, continuous culture, diauxic, synchronous growth cultures and anaerobic cultures	L1, L2, L3	5
Module IV: Nutrition and Metabolism Modern concepts of bacterial nutrition, nutritional categories. Transport of nutrients (diffusion, active transport, group translocation) Introduction to oxidative and substrate level phosphorylations, brief account of metabolism of carbohydrates, EMP, ED, TCA and glyoxylate cycle and nucleic acids as building block in biosynthesis of cell constituents' synthesis of peptidogylcan polymer of cell wall	L1, L2	6
Module V: Microbial Genetics A general account of prokaryotic and eukaryotic genome, recombination, brief account of transformation, conjugation, transduction. concept of operon, induction, repression, catabolite repression. Control of Microorganisms: Control of microbes by physical and chemical agents. Antibiotics, properties and mode of action; Drug resistance and its significance. Antibiotic sensitivity test. Industrial uses of bacteria yeast & molds	L1, L2, L3	8
Module VI: Microbial Ecology Methods in microbial ecology (culture dependent and culture independent techniques), microbial habitats and nutrient cycling (Carbon, sulphur and nitrogen cycles), plant-microbes, animal-microbes' interactions. Soil microorganisms associated with vascular plants, bioremediation and biodegradation	L1, L2, L4	7
Module VII: Applied Microbiology Biocatalysts, microbial metabolites, wine production, single cell proteins, microbial transformation of steroids, role of microbes in food industry, production of dairy products (fermented milks and cheese), Role of microbes in Agriculture (biofertilizers, biopesticides), Wastewater treatment	L1, L2, L3	**7**

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBTH2201 MICROBIOLOGY**				

Catalog Description

This lab course complements the theory course Microbiology (DBLS 2401). This course will introduce the students to basic microbiology lab techniques including media preparation, sterile culture techniques and standard practices and procedures. The approaches are relevant in both basic (biomedical) research and industrial applications of microorganisms.

Course Objectives

This course aims to prepare the students to carry out standard microbiology lab experiments including culture-media preparation, sterilization and sterile lab techniques, isolation and culture of microorganisms from natural sources, microscopic characterization of microorganisms by standard staining procedures.

Course Outcomes (COs):

Upon successful completion of this course, the student will be able to:

CO1: prepare culture media following sterile handling techniques, and sterilisation procedures.

CO2: Characterise bacterial and fungal strains using simple staining techniques, and by biochemical tests.

CO3: Estimate the rate of growth of microorganisms by preparing the Growth Curve using turbidometry technique

CO4: Isolate bacterial strains from natural sources (such as soil and water) and culture them

CO5: Recognise and explain the implications of biofilms in industry, environmental and health contexts.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Standard lab practices, sterilisation techniques, sterile handling techniques.	L1, L2, L3	4
Module II: Preprataion different types of culture media for bacterial culture	L1, L2, L3	4
Module III: Staining techniques: Simple staining, differential staining	L1, L2, L3	4
Module IV: Growth curve measurement of bacterial population by turbidometry.	L1, L2, L3, L4	4
Module V: Biochemical tests to identifies the microorganisms	L1, L2, L3	4
Module VI: Isolation and enrichment culture of microorganisms from natural sources (soil, water)	L1, L2, L3	4
Module VII: Biofilm formation of *Candida auris*: culture and characterization	L1, L2, L3	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2203	CELL BIOLOGY AND GENETICS	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBTH2204 CELL BIOLOGY AND GENETICS LAB**				

Catalog Description

This course offers a comprehensive study of cell biology and genetics, providing students with a thorough understanding of cellular structure, function, and genetic principles. The curriculum covers the molecular and biochemical foundations of cell biology, including cell division, signaling, and the regulation of the cell cycle. Additionally, students will explore fundamentals of molecular genetics, principles of Mendelian inheritance, pedigree analysis in humans, and cancer genetics. The course emphasizes the integration of cell biology and genetics to understand cellular processes and genetic mechanisms

Course Objectives

This course aims to provide a foundational understanding of Cell Biology and Genetics. Students will explore the intricacies of cellular structures, delve into the principles of genetic inheritance, and unravel the molecular mechanisms governing life. By the end of the course, students will possess a comprehensive grasp of fundamental biological processes, from cell division to genetic expression, and be equipped with the knowledge to critically analyze and apply these concepts in diverse biological contexts. Students will also draw and analyse human pedigree charts. In addition, they will learn the basic of principles of cancer genetics, and familiarize with the different model organisms used in this field.

Course Outcomes (COs):

On successful completion of this course, students should be able to:

- Comprehend cellular structures and functions; describe the differences between prokaryotes and eukaryotes.
- Explain the function of the 4 classes of macromolecules (proteins, lipids, carbohydrates and nucleic acids) in the cell, with special emphasis on the structure and diverse functions of nucleic acids
- Explain the stages of cell division in mitosis and meiosis, and their significance. Comprehend the role of Cell cycle regulation mechanisms in regulating cell division.
- Understand the concepts of Mendelian genetics; comprehend the Mendelian principles in light of molecular genetics.
- Apply principles of inheritance in human genetics, draw pedigree charts, analyse the mode of inheritance, and make simple calculations to calculate the probability of inheritance of traits.
- Explain the different kinds of mutations that could predispose to or cause cancer.
- Explain the relevance of different model organisms used in genetics and cell biology research.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Cell is the fundamental unit of life Prokaryotic and eukaryotic cell structure; Overview of Cellular organelles and their functions; Plant cells vs. Animal cells; Haploid vs. Diploid cells, History of significant milestone discoveries in Cell Biology.	L1, L2, L3	5
Module II: Macromolecules as building blocks of cells	L1, L2, L3	5

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

DNA is the genetic material, RNAs have diverse roles, Proteins are the work-horses of the cell, Lipid membranes maintain the integrity of cell and organellar structures, Carbohydrates have structural and energy storage functions.		
Module III: DNA as the genetic material Bacterial chromosome; Eukaryotic Chromosomes, Packaging of DNA into chromosomes	L1, L2	5
Module IV: Cell division Mitosis and Meiosis	L1, L2	4
Module V: Cell cycle and Regulation of Cell cycle Cell cycle check-points, eg. Regulation of M check point	L1, L2	5
Module VI: Cell-Cell communication Autocrine, Paracrine, Juxtacrine and Endocrine signalling, GPCRs and TRK signalling, Insulin signalling, Adrenaline signalling, Importance of signalling in different contexts of development and metabolism Intracellular Compartment and Protein Transport	L1, L2, L3	6
Module VII: Mendelian inheritance Monohybrid cross, Law of segregation, Dihybrid cross, Law of independent assortment, Test cross; Historical perspective: Chromosomal theory of inheritance, Dilemma on nature of genetic material: Protein or DNA; key experiments that lead to establishment of DNA as genetic material Extensions of Mendelian inheritance: (4 lectures) Linkage, Crossing over frequency and gene mapping, Gene interaction (Epistasis), Expressivity, Penetrance, Polygenic traits, Pleiotropic inheritance	L1, L2, L3, L4, , L5	6
Module VIII: Model organisms in Genetics Research Plant, Animal and Single Cell model organisms in Genetics research	L1, L2, L3	4
Module IX: Human genetics Pedigree and Pedigree analysis, Molecular basis of genetic diseases; Cancer genetics	L1, L2, L3, L4	5

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2204	CELL BIOLOGY AND GENETICS LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBTH2203 CELL BIOLOGY AND GENETICS**				

Catalog Description

This lab course complements the lectures, allowing students to gain hands-on experience with modern techniques in cell biology and genetics. This course is fundamental for students pursuing careers in biological sciences and biotechnology.

Course Objectives

This course aims to give the students hands on experience on various aspects of practical research in the fields of cell biology and genetics.

Course Outcomes (COs):

Upon successful completion of this course, the student will be able to:

- Apply standardised experimental procedures to isolate cell organelles
- Observe and distinguish between different stages of cell division (both mitosis and meiosis)
- Draw pedigree chart based on available data, infer the mode of inheritance, and make probability based predictions on the inheritance
- Analyse published (FACS) results (on cell cycle arrest) and infer scientifically valid conclusions
- Extract useful pertinent information from OMIM
- Debate on the ethical considerations surrounding personal genome sequencing

Course Content:

Modules	Blooms level*	Number of hours
Module I: Chloroplast extraction from spinach leaf	**L1, L2, L3**	2
Module II: Mitosis & meiosis (observe prepared slides)	**L1, L2, L3**	2
Module III: Mitosis – onion root tip	**L1, L2, L3**	2
Module IV: Non-disjunction as cause of aneuploidy (case study based activity)	**L1, L2, L3, L4**	2
Module V: Pedigree analysis	**L1, L2, L3, L4**	4
Module VI: Analysis of FACS results in case of mutants in cell cycle regulation. (analysis of experimental data from publications).	**L1, L2, L3, L4**	2
Module VII: Case Study on cancer	**L1, L2, L3, L4**	4
Module VIII: OMIM (Online Mendelian Inheritance in Man) based inquiry into protein structure and genetic disease	**L1, L2, L3**	4
Module IX: Case study on ethical considerations in personal genome sequencing	**L1, L2, L3, L4**	4
Module X: Worm as a model organism	**L1, L2, L3, L4**	2

SEMESTER-III

Course Code: DBTH2351	BIOCHEMISTRY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBTH2352 BIOCHEMISTRY LAB**				

Catalog Description

This course aims to provide a comprehensive understanding of the biochemical principles that govern cellular processes. The course covers the chemical basis of life, focusing on the structure, function, and metabolism of biological molecules such as amino acids and proteins, nucleic acids, lipids, and carbohydrates.

Course Objectives

This course will cover the general properties of all biomolecules, their metabolism and practical approaches to study the same. This will provide a basic understanding of all the essential biochemical species necessary for life.

Course Outcomes (COs):

On completion of the course, the students will be able to:

- Explain the basic principles of biochemistry, and physical and chemical properties of all biomolecules.
- Describe how the biomolecules are metabolized.
- Relate how the structure of biomolecules influences their function and overall cellular homeostasis.
- Propose experiments for quantitative and qualitative analysis of biomolecules.
- Sketch the chemical structures of various biomolecules.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Basic principles • Mole concept, Properties of water; acids, bases and buffers; covalent and non-covalent interactions in biological systems; • Bioenergetics; General understanding of metabolic pathways and principles • Overview of Macromolecules: Proteins, Carbohydrates, Lipids & Nucleic acids – their building blocks, structure, diverse functions in biological system.	L2, L3, L4	4
Module II: Amino acids • Classification, chemical and physical properties • Transamination reaction • Biosynthesis and breakdown of amino acids using few representative examples. • Role of essential proteases and their target sites. • Urea cycle	L1, L2, L3	6
Module III: Proteins • Structural levels of proteins • Nature of peptide bond, phi and psi angles • Types of secondary structural elements - alpha helix, beta conformation, beta turns, Ramachandran plot and its importance • Enzymes: Introduction to kinetic and catalytic mechanisms; • Regulation of enzyme activity; types of enzyme inhibition.	L1, L2, L3, L6	10

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module IV: Carbohydrates • Sugars and Polysaccharides • Carbohydrate metabolism: glycolysis and its regulation • Citric acid cycle and its regulation • Amphibolic nature of Citric acid cycle • Electron transport System • Oxidative phosphorylation and ATP production • Gluconeogenesis • Pentose phosphate pathway	L1, L4, L5	11
Module V: Lipids • Classification, structure and function • Lipids and biological membranes • Lipoproteins • Phospholipids • Sphingolipids • Glycolipids • Fatty acid metabolism: β-oxidation, biosynthesis and regulation; ketone bodies	L1, L2, L4	8
Module VI: Nucleic Acids • Nitrogenous bases • Nucleotides • Structure and properties of nucleic acids • Nucleotide Metabolism: metabolism of purines and pyrimidines	L1, L2	**6**

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2352	BIOCHEMISTRY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBTH2351 BIOCHEMISTRY**				

Catalog Description

This is a laboratory course focusing on the development of intermediate laboratory skills in modern biochemistry using the context of experiments examining biologically relevant molecules. This course is designed to foster skills in proper laboratory practice and record keeping, the use of biochemical instrumentation, the proper interpretation of experimental results, and the effective communication of the results through written reports. This course will provide both a theoretical and practical understanding of basic biochemical methods including the isolation, purification and characterization of proteins, lipids and DNA. Database applications for biotechnological applications will also be discussed.

Course Objectives

The laboratory experiments in Biochemistry would allow the students to get a practical exposure to the properties of biomolecules studied in the course.

Course Outcomes (COs):

CO1: At the end of the course, student will be able to detect, quantitate and analyse various biomolecules.
CO2: They will also learn the associated analytical tools required in the process.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Preparation of buffers useful for biological experiments	L1, L2, L3	4
Module II: Construction of standard plots using graph sheet and MS- Excel	L1, L2, L3	4
Module III: Detection of the presence of amino acids using Ninhydrin Test	L1, L2, L3	2
Module IV: Detection and quantitation of proteins using Bradford test	L1, L2, L3	4
Module V: Colorimetric detection of sugars (Molisch test, Fehling's test, Seliwanoff test)	L1, L2, L3	4
Module VI: Ethanol emulsion test to detect the presence of lipids	L1, L2, L3	4
Module VII: Biochemical estimation of DNA and RNA, Quantitative determination of DNA and RNA by UV spectrophotometer, Determination of purity of nucleic acids, Determination of melting temperature of DNA from thermal denaturation characteristics	L1, L2, L3	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2301	MOLECULAR BIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBTH2302 MOLECULAR BIOLOGY LAB**				

Catalog Description

Molecular biology is the branch of Biology that deals with structure and function of macromolecules essential to life. A course in Molecular Biology should enable the students to understand how 1) the genetic material is passed on from one generation to the next and 2) how the genetic material is expressed and regulates the functioning of the cell.

Course Objectives

The objective of the course is to provide a clear understanding of the basic molecules inside the cell that govern the fundamental processes of life i.e. DNA, RNA and proteins. The structure of these molecules provides important clues to their functions. In addition, DNA being the genetic material in most organisms, studies regarding basic tools and techniques to manipulate it are covered in the syllabus. Strong foundation in molecular biology enables the students to familiarize themselves with basic mechanisms of genes, DNA replication and Gene expression in health and disease.

Course Outcomes (COs):

On completion of this course, students should be able to:

1. Understand and conceptualise the landmark discoveries in Molecular Biology, and their role in furthering our knowledge about the subject.
2. Explain the basic structure of biomolecules and the structure-function relationship within the cell and their role in bringing about the daily physiological functions.
3. Describe the key metabolic processes about their replication, gene expression and protein synthesis and illustrate the similarities and differences between the structure and function of DNA and RNA and their role in origin of life.
4. Explain the principle of central dogma in Molecular Biology; illustrate the principles of positive and negative regulation of gene expression.
5. Recognise the impact of gene mutations or changes in gene sequence and ways to repair them and their role in disease and evolution.
6. Enlist and explain the role of molecular biology in health, diagnostics, recombinant DNA technology, food production, and precision medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Historical developments in genetics leading to evolution of molecular biology. Historical experiments that led to identification of DNA as the genetic material, structure of DNA and RNA, complimentarity, phosphodiester bond, different types of DNA, denaturation and reassociation.	**L1, L2, L3**	7
Module II: DNA replication, replication origin, theta structure, DNA polymerases, modes of replication, mechanism of replication in *E.coli*, synthesis of leading and lagging strands, DNA replication in eukaryotes. DNA repair, mutations, DNA damage, Photoreactivation, Base excision repair, mismatch repair, Nucleotide excision repair.	**L1, L2, L3**	8

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module III: Genome organization in prokaryotes and eukaryotes, genes and pseudogenes, repeated sequences. Transposable elements – transposons, Chromosome structure: heterochromatin, euchromatin, histone proteins, histone code. Chromosomal rearrangements, aneuploidy, chromosomal human diosorders.	**L3, L4, L5**	6
Module IV: Transcription: Gene structure: promoter and coding sequences, regulatory and transcription units, RNA polymerases, basic mechanism of transcription (initiation, elongation and termination) in prokaryotes and eukaryotes, tRNAs, rRNA, microRNA and long noncoding RNA	**L3, L4, L5**	7
Module V: Deciphering the genetic code, Salient fatures of genetic code, Translation – initiation, elongation and termination, Regulation of gene expression, Prokaryotes negative and positive regulation, attenuation, Eukaryotes: Transcription factors, activators and enhancers.	**L3, L4, L5, L6**	7
Module VI: Molecular Biology Techniques: DNA footprinting, Radioactivity, Polymerase Chain reaction, Hybridization, siRNA, EMSA, CRISPR-CAS technique	**L1, L2, L3**	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Pre-requisites	Nil				
Co-requisites	**DBTH2301 MOLECULAR BIOLOGY**				

Catalog Description

The laboratory course consists of Molecular Biology experiments organized in different learning modules and lectures relevant to the experiments. These provide hands on training and in-depth knowledge about methods like isolation, purification, and detection of recombinant DNA and proteins; polymerase chain reaction, its use in diagnosis, cloning and recombinant DNA technology, quantification of denatured DNA and gene expression analysis. The students will learn the basics of experimental design, data analysis, and presenting the report in the lab record book.

Course Objectives

The goal of this course is to familiarize students with Molecular Biology techniques so that they can get absorbed easily in research jobs.

Course Outcomes (COs):

- Acquire a working knowledge of methods in Molecular Biology.
- The student should be able to use standard laboratory equipment and methods frequently used in Molecular Biology research.
- Understand and be able to perform simple data analysis (including statistics) and interpret the results generated.
- To communicate their results in written and oral form.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Isolation of Genomic DNA from E. Coli.	**L1, L2, L3**	3
Module II: Qualitative analysis of Genomic DNA by Agarose Gel Electrophoresis	**L1, L2, L3**	2
Module III: Quantitative analysis of DNA by spectrophotometer	**L3, L4, L5**	2
Module IV: Isolation of Plasmid DNA	**L3, L4, L5**	3
Module V: Restriction enzyme digestion	**L3, L4, L5, L6**	3
Module VI: Competent cell preparation	**L1, L2, L3**	4
Module VII: PCR	**L1, L2, L3, L4**	4
Module VIII: Gel extraction of fragments	**L1, L2, L3**	3

SEMESTER-IV

Course Code: DBTH2401	RECOMBINANT DNA TECHNOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**RECOMBINANT DNA TECHNOLOGY LAB**				

Catalog Description

This course covers the fundamental principles and techniques of recombinant DNA technology. Topics include the functions and uses of various enzymes such as restriction endonucleases and reverse transcriptase (Module I); the use of different cloning and expression vectors, basic cloning strategies, and gene libraries (Module II); blotting techniques and hybridization methods (Module III); and the principles and applications of various PCR techniques (Module IV).

Course Objectives

A basic understanding of molecular techniques can be obtained through the course. The successful application of biotechnology largely depends on these advanced molecular techniques.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand and explain the functions and applications of key enzymes in recombinant DNA technology, including restriction endonucleases, methyltransferases, ligases, and reverse transcriptase.
- Describe various cloning and expression vectors, develop basic cloning strategies, and understand the construction and screening of gene libraries.
- Gain proficiency in blotting techniques and hybridization methods, including Southern, Northern, and Western blotting, using both radioactive and non-radioactive probes.
- Comprehend the principles of PCR, explore various types of PCR techniques, and understand their wide range of applications.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Restriction endonuclease, methyltransferase, ligase, polymerase, kinase, phosphatase, nuclease, transferase, reverse transcriptase.	L1, L2	10
Module II: Cloning vectors: Plasmids, bacteriophages (Lambda and M13), phagemids, cosmids, artificial chromosomes (YAC, BAC). Expression vectors (Bacteria and yeast); Basic cloning strategy and screening clones; Gene libraries	L1, L2	14
Module III: Blotting techniques and hybridization: Southern, Northern and Western blotting techniques. Radioactive and non-radioactive probes.	L1, L2	9
Module IV: Principles of PCR, types of PCRs and its applications	L1, L2, L3	12

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2402	RECOMBINANT DNA TECHNOLOGY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**RECOMBINANT DNA TECHNOLOGY**				

Catalog Description
This course aims to equip students with apply the theoretical knowledge gained in other courses to be translated into practical skills required to excel in the field of recombinant DNA technology and prepare them for advanced studies or careers in biotechnology and related disciplines.

Course Objectives
A basic hands-on training of simple molecular techniques can be obtained through the course. Many advanced application of biotechnology largely depends on these advanced molecular techniques.

Course Outcomes (COs):
On completion of this course, students should be able to:
- Learn the process of making competent *E. coli* cells using $CaCl_2$ to facilitate transformation.
- Transform competent cells with plasmids and understand the principles behind bacterial transformation.
- Master the technique of isolating plasmids from bacterial cells using the alkaline lysis method.
- Estimate DNA concentration and perform gel electrophoresis to analyze DNA samples.
- Gain hands-on experience in digesting DNA with restriction enzymes and interpreting the results.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Making of competent E coli cells using $CaCl_2$	L1, L2, L3	12
Module II: Transformation of competent cells with plasmids	L1, L2, L3, L4	12
Module III: Isolation of plasmids by alkaline lysis method.	L1, L2	12
Module IV: Estimation of DNA concentration and gel electrophoresis.	L2, L3, L4	12
Module V: Digestion of DNA using restriction enzymes.	**L2, L3**	12

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2403	GENOMICS AND PROTEOMICS	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBTH2404 GENOMICS AND PROTEOMICS LAB**				

Catalog Description

This comprehensive course offers an in-depth exploration of genomics and proteomics. It begins with an introduction to DNA structure and function, cells, chromosomes, and genetic inheritance. It covers the human genome, gene roles in health and disease, genetic mutations, DNA microarrays, and the Human Genome Project. The societal impact and ethical considerations of genomics, genetic testing, and personalized medicine are discussed. The course also delves into the world of proteins, their functions, and the techniques used to study them, such as 2D gel electrophoresis and mass spectrometry. Additionally, it explores proteomics' role in disease diagnosis, drug development, and personalized medicine.

Course Objectives

The course helps in developing a detailed understanding of eukaryotic genome complexity and organization. Current research on the molecular basis of the control of gene expression in eukaryotic system has developed a detailed understanding of techniques of gene diagnostics and DNA profile to acquire the fundamentals of genomics and Proteomics.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the basics of DNA structure and genetic inheritance.
- Analyze the human genome and its role in health and disease.
- Explore ethical considerations and societal impacts of genomics.
- Learn knowledge of protein functions and metabolic processes.
- Understand techniques such as PCR, DNA microarrays, and mass spectrometry.
- Apply proteomics in disease diagnosis and personalized medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Genomics: Understand the basics of genomics and the structure of DNA. What is DNA? – Structure and Function, Cells and Chromosomes – Building Blocks of Life, Introduction to Genetic Inheritance – How Traits Are Passed On, Real-Time PCR and Its Application in Genomics.	**L1, L2, L3**	7
Module II: Exploring the Human Genome: Origin of genomes, Human genome and the role genes play in health and disease. Mapping the Human Genome – An Overview, Genes and Their Role in Disease, Genetic Mutations and Variation, DNA Microarrays: An Introduction to Genomic Expression Analysis, Introduction to molecular markers-RFLP, RAPD, AFLP, SSRs, DNA fingerprinting, Human Genome Project.	**L1, L2, L3**	8
Module III: Genomics in Society: Discuss the impact of genomics on society and the ethical considerations. Genetic Testing and Personalized Medicine, Ethics of Genetic Modification and CRISPR, siRNA and miRNA: Small RNAs with Big Roles in Gene Regulation,	**L1, L2**	8

Chromatin Immunoprecipitation (ChIP): Connecting DNA and Protein Interactions.		
Module IV: Introduction to Proteomics: Introduce the world of proteins and their functions in the body. Proteins and Their Functions, From DNA to Protein – Transcription and Translation, Enzymes and Metabolism, Protein Separation Techniques: Diving into 2D Gel Electrophoresis	**L1, L2**	8
Module V: Techniques in Proteomics: Explore how scientists study proteins and their structures. Protein Structure and Function, Introduction to Mass Spectrometry and Protein Sequencing, Protein Interactions and Pathways, Mass Spectrometry in Proteomics: The Mass Spec Revolution, Post-Translational Modifications: Beyond the Genetic Code.	**L1, L2, L3**	8
Module VI: Proteomics in Health and Disease: Understand the role of proteomics in diagnosing and treating diseases. Biomarkers and Disease Diagnosis, Drug Design and Development, Personalized Medicine and Proteomics, Protein-Protein Interactions: Networking in the Cell, Protein Microarrays and Their Applications in Proteome Analysis.	**L1, L2**	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBTH2403 GENOMICS AND PROTEOMICS**				

Catalog Description

This course equips students with practical skills in computational genomics and structural proteomics. It covers the use of bioinformatics tools for DNA sequence analysis, genetic variation identification, and mutation impact prediction. Students will learn to navigate genomic sequences using BLAST, search SNP databases, and utilize genome browsers. The course also delves into protein structure analysis through the Protein Data Bank, visualization with UCSF Chimera, and examination of protein domains and active sites. By understanding the structural effects of mutations, students will gain insights into the functional implications for proteins, enhancing their ability to apply these techniques in research and clinical settings.

Course Objectives

The course helps in developing a detailed understanding of practical skills in laboratory techniques commonly used in genomics and proteomics research.

Course Outcomes (COs):

On completion of this course, students should be able to:

1. Master bioinformatics tools for DNA sequence analysis and genetic variation identification.
2. Predict the impact of genetic mutations on protein function using computational tools.
3. Analyze and visualize protein structures, understanding their functional implications.
4. Explore the structural effects of mutations on proteins and their consequences for disease and therapy.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Computational Genomics Fundamentals **Objective:** Gain hands-on experience with bioinformatics tools to analyze DNA sequences and identify genetic variations. • **BLAST:** Navigating Genomic Sequences - Learn to use BLAST for sequence alignment and identifying gene families, • **Genetic Variation and Disease -** Use databases to search for SNPs and understand their clinical significance, • **Mutation Impact Prediction -** Apply tools like SIFT or PolyPhen to analyze the effects of mutations on protein function, • **Genome Browsers: Windows into Genomic Data** - Get acquainted with tools such as UCSC Genome Browser for in-depth genomic data analysis.	**L1, L2, L3, L4**	15
Module II: Structural Proteomics Analysis **Objective:** Explore protein structure and function through computational analysis and visualization techniques. • **Protein Data Bank (PDB):** The Repository of Protein Structures - Learn to retrieve and analyze protein structures from PDB, • **UCSF Chimera: Visualizing Protein Complexes** - Use UCSF Chimera for protein visualization to study structure-function relationships, • **Protein Domains and Active Sites -** Investigate how proteins perform their functions by examining their active sites and domains,	**L1, L2, L3, L4**	15

SEMESTER-V

Course Code: DBTH2501	PLANT AND ANIMAL BIOTECHNOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**PLANT AND ANIMAL BIOTECHNOLOGY LAB**				

Catalog Description

This course provides an in-depth exploration of the principles and applications of biotechnology in plants and animals. The course covers genetic engineering techniques, tissue culture, molecular markers, and the role of biotechnology in agriculture, medicine, and industry.

Course Objectives

A basic understanding of molecular techniques in plant and animal biotechnology can be obtained through the course. This course will also familiarize students with recent developments in the field of biotechnology.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand and explain the principles and applications of totipotency, plant tissue culture, and in vitro germplasm conservation techniques.
- Analyze the production of secondary metabolites, the development of transgenic plants, and the industrial importance of plant products.
- Evaluate different methods of gene transfer in plants and examine recent advancements in agricultural genetic engineering.
- Cultivate animal cell cultures, understanding media composition, growth kinetics, and techniques for cryopreservation and product development.
- Apply techniques of in vitro fertilization, embryo transfer, and somatic cell hybridization, including hybridoma technology.
- Utilize advanced animal genetic engineering techniques, including gene transfer methods, cloning, and the creation of transgenic and knock-out/knock-in animals.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Totipotency; Regeneration of plants; Plant growth regulators and elicitors; Tissue culture and Cell suspension culture system: methodology, kinetics of growth and, nutrient optimization. Tissue culture and its application, Micropropagation. Meristem culture and production of virus-free plants. Anther and microspore culture. Embryo and ovary culture. Protoplast isolation. Protoplast fusion-somatic hybrids, cybrid. Somaclones, Synthetic seeds. In vitro germplasm conservation.	**L1, L2**	8
Module II: Production of secondary metabolites by plant suspension cultures; Hairy root culture; transgenic plants; Plant products of industrial importance	**L1, L2**	7
Module III: Methods of gene transfer in plants. Achievements and recent developments of genetic engineering in agriculture.	**L3, L4**	7
Module IV: Animal cell culture; Culture media composition and growth conditions; Anchorage and non-anchorage dependent cell culture; Micro & macro-carrier culture; Kinetics of cell growth; Cryopreservation techniques; Cell culture products.	**L1, L2**	8

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**PLANT AND ANIMAL BIOTECHNOLOGY**				

Catalog Description

This course is designed to gain practical experience in the laboratory, emphasizing the development and application of biotechnological tools for improving plant and animal species. This course aims to equip students with the knowledge and practical skills necessary for careers or further studies in plant and animal biotechnology, with a strong emphasis on both scientific and ethical aspects of the field.

Course Objectives

A basic understanding of molecular techniques in plant and animal biotechnology can be obtained through the course. This course will also familiarize students with recent developments in the field of biotechnology.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Demonstrate proficiency in sterilization techniques, preparation of culture media, and inoculation of plant explants.
- Develop skills in culturing plant embryos and seeds, callus culture, and testing seed viability.
- Prepare animal cell culture media, monitor cell doubling time, and assess cell viability using the Trypan blue assay.
- Quantify peroxidase from animal tissue and isolate DNA from animal tissue, applying essential biochemical techniques.
- Understand and logically debate on the ethical issues involved in genetic manipulation of plants and animals.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Sterilization techniques of glass wares & equipments. Preparation of cotton plugs & culture media . Preparation and sterilization of different explants. Inoculation of explants on culture media.	**L1, L2, L3**	8
Module II: Culture of plant embryos/seeds. Callus culture. Testing of seed viability.	**L1, L2, L3**	7
Module III: Preparation of animal cell culture media and monitoring doubling time of cells. Trypsinization of anchorage dependent cells. Trypan blue assay for checking cell viability.	**L1, L2**	8
Module IV: Quantification of peroxidase from animal tissue. Isolation of DNA from animal tissue.	**L1, L2**	7

Course Code: DBTH2503	INTRODUCTION TO IMMUNOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBTH2504 INTRODUCTION TO IMMUNOLOGY LAB**				

Catalog Description

This course explores the role of the basics of physiological defense mechanism, it teaches the learner to identify and investigate different immunological barriers and components of physiology that work at different level of exposure to infections. Introductory immunology course in the biotechnology landscape, leads students in building knowledge to understand the biology of disease and defense mechanism to counter different physiological adversities. The course is theoretically driven and delivers the concepts related to immune components, mechanism of immune action, disease detection and immunological therapies all under one umbrella. Students then use that knowledge to analyze and present their study in detection, sensing, and designing cures for disease management and medical biotechnology in the future.

Course Objectives

The course aims to provide students with a foundational knowledge of immunology, its importance in human health, and its relevance in various aspects of biology and medicine. Role of antibody engineering in biomedical applications and the importance of immune detection in disease processes, tissue transplantation and immune therapies. regulations are some of the areas of attributes of this course which can help the students to understand the biotechnology related to human kind.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall the history of immunology. Explain the cells and organs of immune system evolutionarily contributing in developing defence mechanism.
- Describe the structure, classification and physico-chemical features of antigen and antibody.
- Explain the key mechanistic pathways to establish antigen-antibody reactions, antigen processing and presentation and regulation of immune response.
- Explain the processes involving immune disorders. Illustrate the mechanism of action in developing autoimmune, hypersensitive and immune compromised physiological situations.
- Recognise varied immune responses like active, passive, cell mediated and humoral immune-actions. Recognise the mechanism and significance of complement activation, amplification and attack mechanism.
- Enlist and explain ever increasing advancement in the field of immunotherapy. Elaborate the technology of Monoclonal antibody production, organ and tissue Transplantation, Cancer immunology, Vaccine biology and graft vs host rejection.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Historical perspective of immune system and immunity, innate and specific immunity, humoral immunity, cell-mediated immunity	L1, L2	7
Module II: Antibody structure in relation to function and antigen-binding, types of antibodies and their structures: isotypes, allotypes, idiotypes, genetic basis of antibody diversity, synthesis of antibody and secretion	L1, L2	7
Module III: The organs and cells of the immune system, histocompatibility: structure of MHC class I, II & III antigens & their mode of antigen presentation, MHC restriction, antigens & antigenicity	L1, L2, L3	7

Module IV: Antigen-antibody reaction, measurement of antigen – antibody interaction: agglutination, immunodiffusion, immuno-electrophoresis, ELISA, RIE, production of monoclonal antibodies	L1, L2, L3, L4	8
Module V: Regulation of immune response, immune tolerance, complement system, autoimmunity, hypersensitivity, graft versus host reaction	L1, L2, L3, L4	8
Module V1: Hybridoma technology, introduction to transplantation immunology, introduction to cancer immunology, vaccines (attenuated and recombinant)	L1, L2, L3	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBTH2503 INTRODUCTION TO IMMUNOLOGY**				

Catalog Description

This course explores the role of theoretical knowledge from the Introductory immunology course to corelate with lab-based observation, ideation and application. This course teaches the learner to observe and investigate different immune-components and immune assays in hand. The course is driven wet lab-based, as it delivers the concepts related to the morphology of different cells and components of immune system and explores immune assays to detect abnormal physiological situations. Students then use that knowledge to detect basic differences between blood parameter oriented normal and diseased situations and develop technologies that improvise the therapeutic aspect analytically.

Course Objectives

The course aims to provide students with hands-on experience in laboratory techniques and procedures commonly used in immunology research. It will help students gain a deeper understanding of fundamental immunological concepts and principles and design experiments, plan protocols, and troubleshoot issues that may arise during laboratory work.

Course Outcomes (COs):

After the completion of this course students will be able to:

- Determine the various ways to make buffers and stain compositions of biological interest and their significance.
- Isolate blood cells, prepare blood film, identify the RBCs and WBCs morphology.
- Detect and confirm antigen-antibody reaction for microbial infection.
- Draw standard calibration curve of known concentration Vs Absorbance and from that they can determine the product released from the graph.
- Explain the relationship between different antigen concentration and epitope pattern in relation to antibody reaction on semisolid matrices.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Blood film preparation and identification of blood cells.	L1, L2, L3	2
Module II: Determination of the blood group and Rh factor of an individual.	L1, L2, L3	2
Module III: Separation of lymphocytes from human blood using density gradient media	L1, L2, L3	3
Module IV: WIDAL Test	L1, L2, L3	3
Module V: Radial immuno diffusion test, Ouchterlony double diffusion test	L1, L2, L3 L4, L5	3

Course Code: DBTH2505	COMPUTATIONAL BIOLOGY AND MOLECULAR MODELLING	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**COMPUTATIONAL BIOLOGY AND MOLECULAR MODELING LAB**				

Catalog Description

"Computational Biology and Molecular Modeling" introduces the fundamentals of bioinformatics and its applications in biology and medicine. The course covers biological databases, sequence data extraction, and analysis, phylogenetic analysis methods, protein structure prediction, and protein modeling techniques. Students will gain hands-on experience with tools and software for sequence alignment, gene prediction, and tree creation, equipping them with essential skills for computational biology research and applications.

Course Objectives

The objectives of this course are to build upon undergraduate level knowledge of bioinformatics principles with specific emphasis on biological data and its analysis. The course shall make the students aware of various biological databases and biological software within the context of each topic.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the basics of bioinformatics, the relationship to the Human Genome Project, and utilize various biological databases such as NCBI, EBI, DDBJ, and PDB.
- Extract nucleotide and protein sequence data, understand sequence formats, submit biological data to databases, and perform sequence analysis using alignment tools and gene prediction techniques.
- Create and interpret different types of phylogenetic trees using character and distance-based methods, validate trees, and understand the processes involved in phylogenetic analysis.
- Predict protein secondary and tertiary structures, analyze these structures, and utilize protein structure visualization tools, including the creation and interpretation of Ramachandran plots.
- Understand the principles of protein modeling, including energy minimization, force field methods, and use software tools to model protein structures, focusing on aspects such as buried residues, side chains, and hydrogen bonds.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Bioinformatic/computational biology: Bioinformatics basics; relation to Human Genome project, Computers in biology and medicine; Biological Databases- Protein and nucleic acid databases; Structural databases; Literature database; resources at NCBI; resources at EBI; resources at DDBJ, resources at PDB.	**L1, L2, L3**	8
Module II: Nucleotide and Protein sequence data extraction; Genbank format; sequence data format; submission of biological data to respective databases. Sequence analysis: sequence alignment; pairwise and multiple sequence alignment; ORFs, BLAST tools and types, motif discovery and gene prediction; Tools to perform sequence analysis.	**L1, L2, L3**	8
Module III: Phylogenetic analysis: Introduction; type of trees-cladogram, phylogram, dendrogram, additive and non-additive trees; methods of	**L3, L4, L5**	9

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**COMPUTATIONAL BIOLOGY AND MOLECULAR MODELING**				

Catalog Description

This lab course provides hands-on experience with essential bioinformatics tools and techniques. Students will learn to navigate biological databases (NCBI, Uniprot, EMBL), extract data (Genbank, UniProt, PDB), and perform sequence alignments (BLAST, ClustalW). The course also covers phylogenetic analyses, gene prediction methods (GRAIL, Genscan, Glimmer), protein family databases (SCOP, CATH, Pfam), and tools for protein structure visualization, prediction, and validation using Ramachandran plots.

Course Objectives

The objectives of this course are to build upon undergraduate level knowledge of bioinformatics principles with specific emphasis on biological data and its analysis. The course shall make the students aware of various biological databases and biological software within the context of each topic.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Proficiently navigate and utilize various biological databases such as NCBI, Uniprot, and EMBL to extract relevant biological data.
- Perform pairwise sequence alignment using BLAST and multiple sequence alignment using clustalw, enabling them to compare protein and nucleotide sequences effectively.
- Conduct phylogenetic analyses of protein and nucleotide sequences to understand evolutionary relationships.
- Apply gene prediction methods such as GRAIL, Genscan, and Glimmer to identify genes within a given DNA sequence.
- Utilize different protein family databases (SCOP, CATH, Pfam) and visualization tools to analyze and visualize 2D and 3D protein structures.
- Predict secondary and tertiary protein structures using specialized tools and validate these structures using Ramachandran plots, ensuring accurate structural modeling.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to use of Biological database - Using NCBI and Uniprot web resources.	**L1, L2, L3**	4
Module II: Introduction and use of various databases- NCBI, EMBL	**L1, L2, L3**	2
Module III: Extraction of biological data using resources: Genbank, UniProt, PDB	**L3, L4, L5**	2
Module IV: Pairwise sequence alignment-BLAST	**L1, L2, L3**	2
Module V:. Multiple sequence alignment-ClustalW.	**L1, L2, L3**	2
Module VI: Phylogenetic analyses of protein and nucleotide sequences	**L1, L2, L3**	2

Course Code: DBTH2507	BIOETHICS, BIOSAFETY AND IPR	L	T	P	C
Version	2023	4	0	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

The focus of the course is to recognize, learn and understand the role intellectual property rights (IPR) and its implications in biotechnology sector. The students are intended to learn about the concept of biosafety and bioethics role in domain. This course will make the student gain the knowledge about the ethical implication of biological process and products with recombinant DNA guidelines. The students will practice the GLP and follow guidelines for research involving Transgenic, cloning and new BT technologies.

Course Objectives

This course aims to equip students with a comprehensive understanding of bioethical principles, biosafety practices, and intellectual property rights (IPR) in biotechnology. Students will explore ethical issues in biotechnology and biomedical research, learn to implement biosafety measures, understand IPR and regulatory frameworks (laid down by WIPO), and develop critical thinking skills through case studies. This course prepares students to navigate ethical, safety, and legal challenges in scientific research and innovation.

Course Outcomes (COs):

- Enunciate the fundamental principles of bioethics, including ethical theories and frameworks, and apply them to various biological and biomedical scenarios.
- Acquire knowledge of biosafety levels, guidelines, and practices, and learn to implement appropriate safety measures in biological research and laboratory settings.
- Analyze and discuss ethical issues related to biotechnology and biomedical research, such as genetic engineering, cloning, stem cell research, and human experimentation.
- Discuss the basics of intellectual property rights (IPR) in the context of biotechnology, including patents, trademarks, copyrights, and trade secrets.
- Recognize the national and international regulatory frameworks (WIPO) governing biosafety, bioethics, and IPR, and understand the importance of compliance in research and commercialization.
- Develop critical thinking and decision-making skills by analyzing real-world case studies related to bioethics, biosafety, and IPR, and learn to navigate complex ethical dilemmas in the field of biotechnology.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Bioethics • Overview of bioethics principles; • Historical perspectives on ethical issues in biotechnology; • Emerging ethical issues in genetic research, gene editing, cloning, and stem cell research, Human and animal experimentation, animal rights/welfare, • Informed consent and human subjects research; • Agricultural biotechnology: genetically engineered food, environmental risks, labelling, and public opinion	**L1, L2, L3**	7

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module II: Biosafety and Laboratory Practices • Concept of biosafety: Role of WHO • Risk groups (RG 1, 2, 3, 4) Biosafety levels (BSL-1, BSL-2, BSL-3, BSL-4) and biological safety cabinets classes, lab design and rules • Primary and Secondary containment for biohazards; GRAS organisms; Biohazard sign, Lab safety, Role of Biosafety Officer. • Recommended biosafety levels for infectious agents and infected animals • Definition of GMOs & LMOs; Indian recombinant DNA guidelines. • Environmental risk assessment and food/feed safety assessment of transgenic crops; Principles of safety assessment of transgenic plants: risk assessment steps, concepts of familiarity and substantial equivalence	**L1, L2, L3, L4**	7
Module III Regulatory Frameworks and Policy: • Overview of regulatory bodies in biotechnology at international, national, regional, and institutional levels. • Biosecurity considerations and international agreements (Cartagena protocol, OECD consensus documents, Codex Alimentarius) • Indian regulations (EPA act and rules, RCGM, GEAC, IBSC, Biotechnology Regulatory Authority of India draft bill) • GM labelling and Food Safety and Standards Authority of India (FSSAI) • OECD- GLP and its international status and MAD agreement. • Biosafety Management: The key to the environmental responsible use of biotechnology	**L2, L3, L4, L5**	7
Module IV: Intellectual Property Rights (IPR) and WIPO • Introduction to intellectual property (IP): patents, trademarks, copyrights, industrial design, traditional knowledge, geographical indications, design, plant breeders right (PBR) and layout of IC design, Trade secrets. • Historical context of GATT, WTO, WIPO, and TRIPS • Protection of new GMOs; IP's role in R&D • Plant variety protection and farmers' rights act • Patent databases and country-wise patent searches (USPTO, EPO, India) • Case studies	**L1, L3, L4, L5**	7
Module V: Patenting: • Basics of patents: types of patents; Indian Basics of patents: types, Indian Patent Act 1970, recent amendments • WIPO Treaties, Budapest Treaty, Patent Cooperation Treaty (PCT) • Patent application procedures and filing system • Precautions before patenting, patent application forms and guidelines, fee structures, time frames • Types of patent applications: provisional and complete specifications, PCT and conventional patent applications • International patenting requirements and procedures; financial assistance for patenting, Publication of patents and patent infringement.	**L1, L3, L4, L5, L6**	7
Module VI: Commercialisation of IP: • Licensing and royalty management • Patenting by research students and scientists: university/organizational rules • Collaborative research: IP management, benefit/credit sharing, commercial and non-commercial incentives; • Case studies on national and international BT products and processes.	**L4, L5, L6**	7

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

SEMESTER-VI

Course Code: DBTH2601	BIOPROCESS, & INDUSTRIAL BIOTECHNOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**BIOPROCESS, & INDUSTRIAL BIOTECHNOLOGY LAB**				

Catalogue Description

Industrial biotechnology is an interdisciplinary science that applies principles associated with biology and engineering. This subject provides the knowledge of basic principle of fermentation process, which help students to design, develop and operate industrial level. This fundamental knowledge is essential for students to make their career in industry based on bioprocess. This course also provide the study of industrially relevant microbial strains and processes for production of enzyme, biopolymer and food products.

Course Objectives

The objective of the course is to apply the principles of bioprocess technology in large scale production of primary and secondary metabolites and to understand the basics of traditional and modern industrial fermentation process. After completion of the course, a student will be able to develop the understanding of industrial aspects of biotechnology.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the basic principles and concepts of bioprocess technology.
- Understand the basic aspects of metabolites production at industrial scale.
- Describe the production of primary and secondary metabolites
- Discuss the production of microbial enzymes, biofertilizers, biopesticides and modern biotechnological products
- Describe the production of Mushroom.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Basic principle in bioprocess technology • Advantage of bioprocess over chemical process. • Cell culture techniques • Media formulation • Inoculum development and aseptic transfers.	L1, L2, L3	6
Module II: Process technology for the production of primary metabolites • Baker yeast, • Ethanol, acetone-butanol, • citric acid, amino acids, • Polysaccharides and plastics. • Mushroom production from agro based raw materials and uses. • Biofertilizers and biopesticides.	L1, L2, L3, L4	18
Module III: Production of secondary metabolites • Cephalosporin, penicillin, Streptomycin, Tetracycline etc.	L1, L2, L3, L4	12

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**BIOPROCESS, & INDUSTRIAL BIOTECHNOLOGY**				

Catalog Description

This course provides an in-depth knowledge of the techniques and methodologies utilized in bioprocessing and industrial biotechnology. Students will gain practical experience in the design and optimization of bioprocesses for the production of bio-based products and will be equipped with the knowledge and skills necessary to contribute to the development and optimization of bioprocesses in academic, industrial, and research settings.

Course Objectives

The objectives of this laboratory course are to provide hands-on training to students in upstream and downstream unit operations. The lab is designed to train students in using microbial cells and cultures for the fermentative production of valuable products at both laboratory and industrial scales.

Course Outcomes (COs):

Students should be able to:

- Isolate and identify industrially important microorganisms for various microbial processes.
- Determine the growth curve and substrate degradation of a given microorganism.
- Establish the Thermal Death Point and Thermal Death Time of microorganisms to inform sterilizer design.
- Compare ethanol production efficiency using various substrates.
- Produce and estimate alkaline protease from microbial cultures.
- Generate single-cell protein and evaluate its production process.
- Apply alginate for effective cell immobilization in bioprocess applications.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Isolation of industrially important microorganisms for microbial processes.	L1, L3 L4, L6	4
Module II Determination of growth curve of a supplied microorganism and determine substrate degradation.	L1, L2, L3 L4	4
Module III: Determination of Thermal Death Point and Thermal death time of microorganisms for design of a sterilizer	L1, L3 L4, L5	4
Module IV: Comparative studies of ethanol production using different substrates.	L1, L2 L3, L4	4
Module V: Production and estimation of alkaline protease	L1, L3 L	4
Module VI: Production of single cell protein	L1,L2 L3, L4,	6
Module VII: Use of alginate for cell immobilization	L1, L3 L4, L6	4

Course Code: DBTH2603	ENZYMOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**ENZYMOLOGY LAB**				

Catalog Description

This course explores the role of enzymes and their function in metabolism, teaches the learner to observe and investigate acts of enzymes in biochemical pathways in the biotechnological landscape, and leads the student towards understanding metabolism and signaling of different biomolecules undergoing biochemical processes. The course is theoretically driven, as it delivers the concepts related to fundamental concepts of enzymes and catalysis, kinetics, large-scale production-purification of biomolecules, and their application in allied fields. Students then use that knowledge to analyze and evaluate current trends and future aspects of Enzymology and Enzyme technology.

Course Objectives

The course aims to provide an understanding of the principles and application of proteins, secondary metabolites and enzyme biochemistry in therapeutic applications and clinical diagnosis. The theoretical understanding of biochemical systems would certainly help to interpret the results of laboratory experiments

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall history of enzymology. Describe fundamental and molecular principles of Enzymes, enzyme classification, mechanisms of rate enhancement of different biochemical reactions contributing evolutionarily in metabolic pathways.
- Understanding the qualitative and quantitative analysis of biochemical (Metabolic) pathways in relationship to enzymes. Explain single substrate and multi-substrate enzyme kinetics.
- Describe the basics of enzyme inhibition, feedback mechanism and microenvironmental factors associated to biocatalysis.
- Explain the process involved with large scale enzyme production, purification and role of recombinant DNA technology in advancement of such processes.
- Enlist and explain ever increasing advancement in the field of enzyme technology. Elaborate current trend of enzyme technology like enzyme immobilization, concepts of hybrid enzymes and benefit their application in agriculture, medical and industrial landscapes.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Enzymes Introduction and scope, Nomenclature, Mechanism of Catalysis. Specificity of enzyme action, monomeric and oligomeric enzymes, Enzyme inhibition.	**L1, L2, L3**	10
Module II: Enzyme Kinetics Single substrate steady state kinetics; Michaelis Menten equation, Linear plots, Inhibitors and activators; Multisubstrate systems; Allosteric enzymes	**L1, L2, L3**	9
Module III:. Enzyme Immobilization Immobilization of Enzymes; Advantages, Carriers, adsorption, covalent coupling, cross-linking and entrapment methods, Micro-environmental effects.	**L3, L4, L5**	10

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**ENZYMOLOGY**				

Catalog Description

This course explores the in-hand experience of understanding biochemical reactions driven by Enzymes, teaches the learner to observe, perform and investigate enzyme-driven metabolic pathways in the biotechnology landscape, and leads the student through the process of building experimental design, hypothesis development, and process standardizations. The course is driven on wet lab experiments, as it delivers the concepts related to the design of laboratory experiments, analysis, and quality assurance of different enzyme-driven bioassays. Students then utilize the combination of theoretical and practical knowledge of enzyme and enzyme technology in applied aspects.

Course Objectives

The course aims to provide students with hands-on experience in laboratory techniques and procedures commonly used in Enzymology research. It will help students gain a deeper understanding of fundamental enzymological concepts and principles and design experiments, plan protocols, and troubleshoot issues that may arise during laboratory work.

Course Outcomes (COs):

After the completion of this course students will be able to:

- Determine the various ways of calculating enzyme activity of enzymes like alpha and beta amylase etc.
- Draw standard calibration curve of known concentration Vs Absorbance and from that they can determine the product released from the graph.
- Find the optimum temperature and pH at which the enzyme activity is maximum.
- Able to draw and interpret the Michaelis Menton hyperbolic curve and know the importance of Lineweaver Burk Plot.
- Explain the effect of different concentration of substrates on the enzyme activity of various enzymes.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Isolation of enzymes from plant and microbial sources.	**L1, L2, L3**	6
Module II: Enzyme assay; activity and specific activity – Amylase	**L1, L2, L3**	4
Module III: Standard Curve Preparation: Maltose	**L3, L4, L6**	4
Module IV: Effect of varying substrate concentration on enzyme activity, determination of Michaelis-Menten constant (K_m) and Maximum Velocity ($V_{max.}$) using Lineweaver-Burk plot. Catalytic efficiency and catalytic constant.	**L1, L2, L3, L4**	6
Module V: Effect of Temperature and pH on enzyme activity.	**L4, L5, L6**	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2605	PHARMACEUTICAL BIOTECHNOLOGY AND DRUG DESIGN	L	T	P	C
Version	2023	4	0	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course explores the role of biotechnology in drug development, teaches the learner to observe and investigate components and techniques of biology in identifying, understanding and designing cures to diseases in a biotechnological landscape. This course leads the student through the process of understanding pharmacology in the light of life science. The course is theoretically driven, as it delivers the concepts related to drugs, composition, stability, manufacturing, packaging and marketing aspects of pharmaceutical biotechnology through lectures and literatures. Students then use that knowledge to analyze and develop bioanalytical techniques relevant to drug discovery and disease management.

Course Objectives

The course aims to provide an understanding of the principles and application of molecules, Ligands, receptors and disease pathways in therapeutic applications and clinical diagnosis. The theoretical understanding of biotechnological systems would certainly help to interpret the results of laboratory experiments of managing physiological complications and their therapeutic management.

Course Outcomes (COs):

On successful completion of this course, student will be able:

- Recall the history of pharmaceutical biotechnology and illustrate conventional drug design methodology.
- Explain different dosage forms and physicochemical properties of drug.
- Illustrate pharmacokinetics and pharmacodynamics.
- Explain and recognise regulatory attributes and guidelines of biotechnology based pharmaceutical production and marketing ethics.
- Enlist and explain ever increasing advancement in the field of pharmaceutical biotechnology. Elaborate the technology of computational biology in current edge drug design and development.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Pharmaceutical Biotechnology Introduction to Pharmaceutical Biotechnology and History, Drug Discovery Process and Development	**L1, L2, L3**	5
Module II: Physicochemical Factors Governing Drug Formulation Hydrogen bond and Intermolecular forces, Solubility and Partition coefficient, Viscosity and Rheology, pH, Ionization state, Molecular weight and size, Particle technology, Phase separation.	**L1, L2, L3**	10
Module III: Drug Kinetics Effects of route of administration, Drug Targets, Pharmacokinetics and pharmacodynamics of drugs, Drug Delivery System – rate, time and release, Drug stability, Drug Toxicity.	**L3, L4, L5**	10
Module IV: Regulations and Guidelines	**L1, L2, L3,L6**	10

Course Code: DBTH2606	INTRODUCTION TO NEUROSCIENCE AND INFORMATION FLOW	L	T	P	C
Version	2023	4	0	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course provides an overview of the neuroscience topics starting from structure and function to disease development that help the learners to acquire a basic knowledge of neuroscience. This course also explores fundamental knowledge behind Behavioral neuroscience, ethics and emerging topics.

Course Objectives

The objective of this course is to introduce undergraduate students to the basic knowledge in Neuroscience in topics ranging from structure of neuron, information transmission through nervous system, function of sensory systems, basics of Behavioral neuroscience, and diseases of the nervous system. This course will also introduce students to the ethics of research in neuroscience and provide a glimpse of recent research in this field

Course Outcomes (COs):

- Describe the basic principles and structure of the nervous system, including neural cell types, neuroanatomy, and neural development.
- Comprehend the mechanisms of neural signalling, including action potentials, synaptic transmission, and neurotransmitter function.
- Analyse the organization and function of sensory and motor systems, including the pathways and processes involved in sensory perception and motor control.
- Explain the relationship between brain function and behaviour, examining how neural circuits influence cognitive processes, emotions, and actions, using specific examples.
- Identify and describe specific examples of neurological and psychiatric disorders, understanding their underlying neural mechanisms and potential treatments.
- Discuss the current advancements and future directions in neuroscience research, and the ethical considerations in this field of research.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Foundations of Neuroscience: • Introduction to neuroscience • Historical perspectives • Overview of the nervous system • Neuron structure and function	L1, L2, L3	6
Module II: Neural Communication: • Action potentials and membrane potential • Synaptic transmission • Neurotransmitters and receptors • Neural circuits and signalling pathways	L1, L2, L3	8
Module III: Sensory Systems and Motor Systems: • Introduction to Vision, Auditory, Olfactory, Gustatory and Somatosensory System • Motor neurons and muscle contraction	L3, L4, L5	10

SEMESTER-VII

Course Code: DBTH2701	ADVANCED BIOCHEMISTRY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description
This graduate-level course offers an in-depth exploration of advanced topics in biochemistry, focusing on the molecular mechanisms that govern cellular processes. It covers the structure and function of biomolecules, metabolic pathways, enzyme kinetics, molecular signaling, and the latest research techniques in biochemistry.

Course Objectives
The primary focus of this course is advanced understanding of protein structure and enzymology. It is also aimed to expose the students to the technological applications in understanding the process of photosynthesis, and production of secondary metabolites through metabolic engineering.

Course Outcomes (COs):
By the end of this course, students will be able to:

- Explain the structure, function, and dynamics of proteins, including protein folding, interactions, and techniques for protein analysis.
- Analyze the principles of enzyme kinetics, mechanisms of enzyme action, roles of co-enzymes & co-factors, and methods for studying enzyme activity and regulation.
- Comprehend the coordination and regulation of cellular metabolic pathways by hormones and their impact on overall metabolic homeostasis.
- Explore the regulatory mechanisms involved in photosynthesis, including the light-dependent and light-independent reactions and their integration within the plant cell.
- Investigate the biosynthesis, functions, and ecological roles of secondary metabolites in plants, as well as their applications in biotechnology and medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Proteins Types of proteins and their classification, Forces stabilizing protein structure and shape. Different Level of structural organization of proteins, Protein Purification. Denaturation and renaturation of proteins. Fibrous and globular protein.	L1, L2, L3	8
Module II: Enzymes Enzyme, prosthetic groups, metalloenzymes, monomeric & oligomeric enzymes, activation energy and transition state, enzyme activity, specific activity, common features of active sites, enzyme specificity: types & theories, Biocatalysts from extreme thermophilic and hyperthermophilic archaea and bacteria. Role of: NAD+, NADP+, FMN/FAD, coenzymes A, Thiamine pyrophosphate, Pyridoxal phosphate,lipoic-acid, Biotin vitamin B12, Tetrahydrofolate and metallic ions	L1, L2, L3	10
Module III: Integration of cellular metabolism and hormonal regulation Action of major hormones (insulin, glucagons, epinephrine) responses to metabolic stress; starvation, metabolic disorders (phenylketonuria, arthritis) and role of antifolates in chemotherapy.	L1, L2, L3, L4	9

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

Module IV: Regulatory aspects of photosynthesis Mechanism of light interacting with photo pigments, energy transfer and transduction process during photosynthesis, artificial light harvesting system and application in carbon sequestration, Engineering of Rubisco enzyme for photosynthetic process optimization.	L1, L2, L3	9
Module V: Secondary plant metabolism Importance of secondary metabolites, classification, terpenes, Mevalonic acid pathway, phenolic compounds and alkaloids. Application of metabolic engineering in production of any two class of secondary metabolites. Contribution of metabolic engineering principles in promoting Green Chemistry.	L1, L2, L3	9

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2702	ADVANCED BIOCHEMISTRY AND ANALYTICAL TECHNIQUES LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

The course incorporates practical laboratory experience into students, preparing students for research and professional careers in biochemistry and related fields. This course aims to equip students with advanced knowledge and skills in biochemistry, fostering their ability to conduct independent research and contribute to the scientific community.

Course Objectives

The course aims to provide an advanced understanding of the core principles and topics of Biochemistry and their experimental basis.

Course Outcomes (COs):

- Develop the ability to use colorimetric techniques to quantify biomolecules by measuring their absorbance properties.
- Gain proficiency in various chromatographic methods to separate, identify, and analyze complex biological mixtures.
- Master the techniques of PAGE and SDS-PAGE for the separation, visualization, and analysis of protein samples.
- Acquire skills in extracting total lipids and separating them using thin layer chromatography, including calculating Rf values for lipid identification.
- Learn to characterize isolated nucleic acids by performing and interpreting agarose gel electrophoresis results.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Colorimetry Colorimetry and Spectrometry: Beer Lambert's law, Transmittance, Absorbance, Optical density; Types of Spectroscopies: UV & Visible - Principle, instrumentation & application.	L2, L3	6
Module II: Chromatographic Techniques Partition- Adsorption-Ion Exchange- Molecular sieve and Affinity chromatography; Principles of Gas Liquid chromatography and High-Performance Liquid Chromatography.	L3, L4	6
Module III: Proteins Electrophoretic (PAGE and SDS-PAGE) separation of isolated proteins.	L3, L4	6
Module IV: Lipids Extraction of total lipids by Folch's method; thin layer chromatographic separation of lipids, R_f value	L2, L3	6
Module V: Nucleic Acid Characterization of isolated nucleic acid by agarose gel electrophoresis.	L3, L4	6

Course Code: DBTH2703	ADVANCED MICROBIOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	**DBTH2704 ADVANCED MICROBIOLOGY LAB**				

Catalog Description

This course will build upon ideas introduced in general microbiology classes by using microbiological techniques to study and identify unknown organisms. In addition to studying microbial diversity, students will learn the similarities and differences between microorganisms in their genetic, biochemical and metabolic profile. The different mechanisms of checking the growth and spread of microorganisms, and the interaction of microorganisms with their hosts and environment will also be discussed.

Course Objectives

The objectives of this course are to introduce field of microbiology with special emphasis on microbial diversity, morphology, physiology and nutrition; methods for control of microbes and host- microbe interactions.

Course Outcomes (COs):

Students should be able to:

- Identify major categories of microorganisms and analyze their classification, diversity, and ubiquity;
- Identify and demonstrate structural, physiological, genetic similarities and differences of major categories of microorganisms;
- Identify and demonstrate how to control microbial growth;
- Demonstrate and evaluate interactions between microbes, hosts and environment

Course Content:

Modules	Blooms level*	Number of hours
Module 1 Microbial characteristics Introduction to microbiology and microbes, history & scope of microbiology, morphology, structure, growth and nutrition of bacteria, bacterial growth curve, bacterial culture methods; bacterial genetics: mutation and recombination in bacteria, plasmids, transformation, transduction and conjugation; antimicrobial resistance	L1, L2, L3	6
Module 2 Microbial diversity Microbial taxonomy and evolution of diversity, classification of microorganisms, criteria for classification; classification of bacteria; Cyanobacteria, acetic acid bacteria, Pseudomonads, lactic and propionic acid bacteria, endospore forming bacteria Mycobacteria and Mycoplasma. Archaea: Halophiles, Methanogens, *Hyperthermophilic archae*, Thermoplasm; eukarya: algae, fungi, slime molds and protozoa; extremophiles and unculturable microbes.	L1, L2, L3	6
Module 3 Control of microorganisms Sterilization, disinfection and antisepsis: physical and chemical methods for control of microorganisms, antibiotics, antiviral and antifungal drugs, biological control of microorganisms.	L1, L2, L3	6

Course Code: DBTH2704	ADVANCED MICROBIOLOGY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBTH2703 ADVANCED MICROBIOLOGY**				

Catalog Description

The Advanced Microbiology Lab course offers hands-on experience with sophisticated techniques in microbiological research. Students will engage in practical applications of microbial culturing, genetic manipulation, and biochemical analysis. Key areas include microbial physiology, biofilm formation, and pathogen identification. This course is designed to complement Advanced Microbiology (DBLS2703) lectures, imparting essential skills for research and industry applications.

Course Objectives

This course aims to impart hands-on experience in basic microbiology tools and techniques, training to work on research projects as a team, along with essential skills in designing & conducting experiments, data collection & analysis, and record keeping & scientific communication.

Course Outcomes (COs):

Upon completion of this course, students will:

- Gain hands-on experience in culturing, isolating, and identifying various microorganisms using advanced microbiological techniques.
- Conduct experiments to understand microbial growth, metabolic pathways, and physiological responses under different environmental conditions.
- Investigate the mechanisms of biofilm development and the pathogenicity of microorganisms through practical experimentation.
- Develop skills in data collection, statistical analysis, and interpretation of experimental results in microbiology.
- Work collaboratively in a team setting to conduct experiments, analyze results, and present findings clearly and professionally.
- Adhere to strict laboratory safety protocols and maintain accurate, detailed laboratory records.

Course Content:

Modules	Blooms level*	Number of hours
Module 1: Sterilization, disinfection and safety in microbiological laboratory.	**L1, L2, L3**	2
Module 2: Preparation of media for cultivation of bacteria.	**L1, L2, L3**	2
Module 3: Isolation of bacteria in pure culture by streak plate method.	**L1, L2, L3**	2
Module 4: Study of colony and growth characteristics of some common bacteria: Bacillus, E. coli, Staphylococcus, Streptococcus, etc.	**L1, L2, L3**	2
Module 5: Preparation of bacterial smear and Gram's staining.	**L1, L2, L3**	2

Module 6: Enumeration of bacteria: standard plate count.	**L1, L2, L3,L4**	2
Module 7: Antimicrobial sensitivity test and demonstration of drug resistance.	**L1, L2, L3, L5**	4
Module 8: Maintenance of stock cultures: slants, stabs and glycerol stock cultures	**L1, L2, L3**	2
Module 9: Determination of phenol co-efficient of antimicrobial agents.	**L1, L2, L3**	2
Module 10: Determination of Minimum Inhibitory Concentration (MIC)	**L1, L2, L3**	4
Module 11: Biofilm formation of Candida auris: culture and characterisation	**L1, L2, L3, L4**	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2705	ADVANCED CELL BIOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course explores cellular dynamics, chromatin structure, signal transduction, cellular processes, and advanced techniques for studying cells. It covers organelle interactions, gene regulation, cell cycle, differentiation, stress responses, microscopy, DNA/RNA/protein analysis, genome instability, cell transformation, and stem cells and their applications.

Course Objectives

This Advanced Cell Biology course explores the intricacies of cellular processes and covers topics ranging from subcellular organelles, signal transduction, and stem cell applications. This course also delves into complex cell cycle regulation and apoptosis pathways. By course end, the student is expected to possess a deepened understanding of advanced cell biology, ready for research and application in contemporary scientific endeavours.

Course Outcomes (COs):

Upon successful completion of the course, students will be able to:

- Understand the dynamic organization of subcellular organelles and membrane dynamics.
- Learn chromatin structure, remodelling, and epigenetic modifications affecting gene expression.
- Learn about signal transduction pathways, intracellular transport mechanisms, and vesicular trafficking.
- Gain insights into cell cycle regulation, cellular differentiation, stress responses, and cell death mechanisms.
- Understand genome instability, cell transformation, and their implications for disease and therapeutic interventions.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Dynamic Organization of Cell • Subcellular organelles and their dynamic interactions • Membrane dynamics and vesicle trafficking • Cellular compartmentalization and its functional significance	**L1, L2**	6
Module II: Chromatin Structure and Dynamics • DNA packaging in the nucleus • Chromatin remodeling and epigenetic modifications • Regulation of gene expression through chromatin modifications	**L1, L2**	6
Module III: Cellular Signaling, Transport, and Trafficking • Signal transduction pathways and molecular cascades • Intracellular transport mechanisms • Vesicular trafficking and its role in cellular processes	**L1, L2**	6
Module IV: Cellular Processes • Cell cycle regulation and checkpoints	**L1, L2**	6

Prof. (Dr.) Anil Kumar

• Cellular differentiation and development • Cellular responses to stress and environmental cues • Cell death mechanisms and regulation		
Module V: Manipulating and Studying Cells • Isolation of cells and basics of cell culture • Observing cells under a microscope • Different types of microscopy techniques and their applications	**L1, L2, L3**	6
Module VI: Analyzing and Manipulating DNA, RNA, and Proteins • DNA and RNA extraction techniques • Polymerase chain reaction (PCR) and gene expression analysis • Protein isolation, purification, and analysis method	**L1, L2, L3**	6
Module VII: Genome Instability and Cell Transformation • Mechanisms of genome instability • Cell transformation and carcinogenesis • Implications for disease and therapeutic interventions	**L1, L2**	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2706	ECOLOGY AND EVOLUTION	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

The term environment is used to describe, in aggregate, all the external forces, influences and conditions which affect life, nature, behavior and the growth, development and maturity of living organisms. In present condition huge increase in environmental issues, have grown to complexity day by day with threat of human existence on earth. A study of environmental changes is quite essential in all types of environmental conditions to have control over urban & industrial development. It can also enlighten the masses about the importance of the protection and conservation of our environment and control of human activities which has an adverse effect on the environment. This course also emphasizes the coevolution of organisms and surroundings together with harmony for the coexistence of life on earth.

Course Objectives

This course aims to provide a comprehensive understanding of the principles of ecology and evolution and their interconnectedness. Students will explore the fundamentals of ecology, including population dynamics and community interactions, to understand the complex relationships within ecosystems. They will delve into the mechanisms of evolution, such as natural selection and genetic drift, to comprehend how biodiversity arises and changes over time. The course will also cover applied aspects of ecology and evolution, enabling students to apply theoretical knowledge to real-world issues like conservation, resource management, and the impacts of climate change on ecosystems and biodiversity. Students will also gain real world experience through field work.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand and explain the basic principles of ecology, including population dynamics, species interactions, and community structure.
- Analyse the components and functioning of ecosystems, including energy flow, nutrient cycling, and the impact of human activities on ecosystem health.
- Comprehend the mechanisms
- driving evolution, such as natural selection, genetic drift, and gene flow, and explain how these processes contribute to the diversity of life.
- Apply ecological and evolutionary theories to practical challenges in conservation, resource management, and assessing the ecological impacts of environmental changes.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Fundamentals of Ecology Definition, scope, and importance; Abiotic and biotic components; scales (population, species, community, ecosystems, biomes); niches and habitats. Population ecology: Population growth rate, metapopulation ecology Interactions: Ecophysiology (physiological adaptations to abiotic environment. Community ecology.	L1, L2, L3	4

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module II: Ecosystems Concept of an ecosystem, structure, and function of ecosystems: trophic levels and their interactions; nutrient cycles; primary and secondary productivity, Producers, consumers, and decomposers Energy flow in the ecosystem; Ecological succession; Food chains, food webs and ecological pyramids, introduction, types, characteristic features, structure, and function	L1, L2, L3	8
Module III: Evolution Theory & History of Evolutionary thought: Lamarckism; Darwinism; Modern Synthesis Fundamentals: Variation; heritability; natural selection; fitness and adaptation; types of selection (stabilizing, directional, disruptive) Diverse lifeforms: Origin and history of life on earth; diversity and classification of life; systems of classification (cladistics and phenetics) Interactions: Co-evolution, prey-predator interactions. Population and Quantitative genetics, molecular evolution, phylogenetics and molecular systematics Macroevolution: Species concepts and speciation; adaptive radiation; convergence; biogeography	L3, L4, L5	12
Module IV: Applied Ecology & Evolution Natural resources and associated problems Biodiversity and conservation: Importance of conserving biodiversity Conservation of biodiversity: In-situ and Ex-situ conservation of biodiversity Conservation genetics (genetic diversity, inbreeding depression); DNA fingerprinting and DNA barcoding Disease ecology and evolution: Epidemiology; antibiotic resistance; vector Control Plant and animal breeding: marker assisted breeding; genetic basis of economically important traits, global climate change: causes; consequences; mitigation Environment protection law	L3, L4, L5	12
Module V: Field Work Visit to a local area to document environmental assets-river / forest/ grassland/ hill/ mountain. Visit to a local polluted site – Urban / Rural / Industrial / Agricultural Study of common plants, insects, birds Study of simple ecosystems-pond, river, hill slopes, etc.	L3, L4, L5, L6	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2707	GENETICS	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

Genetics is the study of principles and mechanisms of inheritance. In this course students will understand the fundamental principles of inheritance unraveled by Gregor Mendel, who is considered the father of Genetics. Students will explore the mechanisms of inheritance in a range of organisms from bacteriophages to bacteria to yeast and higher organisms including fruit-fly, plants and humans. Students will also get introduced to concepts in population genetics and quantitative inheritance.

Course Objectives

This course aims to provide the students with a strong foundation in the knowledge and applications of principles and mechanisms of inheritance in a range of organisms including bacteriophages, bacteria, yeast, Drosophila, plants and humans. Furthermore, the basics of the principles of inheritance of quantitative traits, and the principles of inheritance at the population level will also be imparted.

Course Outcomes (COs):

On successful completion of this course, student will be able:

- Explain and analyse the genetic mechanisms of bacteria and bacteriophages, including gene transfer, mutation, and recombination.
- Interpret the role of yeast as a model organism for studying eukaryotic gene function and regulation.
- Explain the utility of *Drosophila melanogaster* as a model system to investigate genetic principles applicable to higher eukaryotes.
- Apply the principles of Mendelian inheritance in evaluating genetics crosses and determining genetic map distances in *Drosophila*.
- Apply the principles of population genetics to study the genetic structure of populations and the forces driving changes in the genetic composition of the population.
- Examine the genetic basis of complex traits and the methodologies used to identify quantitative trait loci (QTLs).
- Examine the genetic techniques underlying plant breeding.
- Conduct pedigree analysis and interpret complex pedigrees to identify modes of inheritance and calculate genetic risks for individuals.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Genetics of bacteria and bacteriophages Concept of a gene in pre-DNA era; mapping of genes in bacterial and phage chromosomes by classical genetic crosses; fine structure analysis of a gene; genetic complementation and other genetic crosses using phenotypic markers; phenotype to genotype connectivity prior to DNA-based understanding of gene	L1, L2, L3	4
Module II: Yeast genetics Meiotic crosses, tetrad analyses, non-Mendelian and Mendelian ratios, gene conversion, models of genetic recombination, yeast mating type switch; dominant and recessive genes/mutations, suppressor or modifier screens,	L1, L2, L3	4

Prof. (Dr.) Anil Kumar

Manesar Gurgaon-122413

complementation groups, transposon mutagenesis, synthetic lethality, genetic epistasis. Tetrad analysis in Neurospora		
Module III: Drosophila genetics as a model of higher eukaryotes Monohybrid & dihybrid crosses, back-crosses, test-crosses, analyses of autosomal and sex linkages, screening of mutations based on phenotypes and mapping the same (three-point-crossover mapping), hypomorphy, genetic mosaics, genetic epistasis in context of developmental mechanism;	L1, L2, L3, L4	8
Module IV: Population genetics and genetics of evolution Introduction to the elements of population genetics: genetic variation, genetic drift, neutral evolution; mutation selection, balancing selection, Fishers theorem, Hardy- Weinberg equilibrium, linkage disequilibrium; in-breeding depression & mating systems; population bottlenecks, migrations,	L1, L2, L3	5
Module V: Quantitative genetics of complex traits (QTLs) Complex traits, mapping QTLs, yeast genomics to understand biology of QTLs.	L1, L2, L3, L4	3
Module VI: Plant genetics Laws of segregation in plant crosses, inbreeding, selfing, heterosis, maintenance of genetic purity, gene pyramiding.	L1, L2, L3	2
Module VII: Human Pedigree analysis Modes of Inheritance, prediction of probability of progeny genotype based on pedigree analysis	L1, L2, L3, L4, L5	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2708	BASICS OF CHEMISTRY AND PHYSICS	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course will explore the essential principles of physics and chemistry through the lens of biology. Tailored for non-majors, this class aims to provide a solid foundation in the physical and chemical concepts crucial to understanding biological processes.

Course Objectives

In this course, students will delve into the key principles that underpin biological phenomena including topics on Classical Mechanics, Wave & Optics, Electricity & Magnetism, and Thermodynamics. Topics include classical mechanics, chemical reactions in biological systems, and the application of thermodynamics to biological processes.

Through interactive lectures, and real-world examples, students will gain practical insights into how physics and chemistry shape the living world.

Course Outcomes (COs):

This course will enable the students to attain the following:

- Explore fundamental concepts such as motion, forces, and energy to develop a foundational understanding of the physical principles governing biological systems.
- Explain the fundamental principles in waves & optics, and electricity and magnetism, along with the relevance of these principles in the various tools used in biological research.
- Examine Chemical Processes in Biological Systems including enzyme catalysis and cellular metabolism, to comprehend how chemical interactions drive biological functions at the molecular level.
- Gain proficiency in applying thermodynamic principles to analyze energy transfer and transformations within living organisms, emphasizing their relevance to cellular processes and homeostasis.
- Develop problem-solving skills by applying both physics and chemistry concepts to address real-world biological challenges.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Importance of Physics in Biology • Importance of Physics in understanding biological processes	L1, L2	1
Module II: Mechanics: Motion and Forces • Kinematics (1D and 2D motions) • Dynamics: Newton's laws of motion; • Application of Newton's 2nd law in Linear, Circular motions (briefly, mention other kinds of motion – rotational and oscillatory (e.g. SHM)) • Principle of Conservation of Energy • Principle of Conservation of Momentum	L1, L2, L3	5
Module III: Waves and Optics in Biological Systems • Basics of wave motion • Light as a wave • Ability of light to cause atomic excitation and its Biological significance (eg. Biofluorescence, Photosynthesis)	L1, L2, L3	4

Prof. (Dr.) Anil Kumar
Deputy Dean Academics

• Applications of optics in biology (e.g., Compound microscopy, Confocal microscopy, Fluorescence microscopy)		
Module IV: Electricity and Magnetism in Biological Systems • Basics of electricity and magnetism • Membrane potentials and electrical signaling in cells • Magnetic resonance imaging (MRI) in biological research	L1, L2	3
Module V: Introduction to Chemistry in Biology • Overview of the course content • Importance of chemistry in biological processes • Basic chemical terminology and concepts	L1, L2	1
Module VI: Section: Organic Chemistry **Structure, Bonding and Nomenclature in Organic Molecules** • Structure & nomenclature of organic molecules • Bonding in organic compounds • Isomerism in organic chemistry	L1, L2	2
Module VII: Functional Groups and Reactions • Common functional groups in biomolecules (aldehyde, ketone, alcohol, acid, amine, amide, ester) • Chemical reactions in organic chemistry • Stereochemistry in biomolecules	L1, L2	2
Module VIII: Section: Physical Chemistry **Thermodynamics in Biological Systems** • First and Second Laws of Thermodynamics • Enthalpy, entropy, and Gibbs free energy • Thermodynamics of biological processes	L1, L2	3
Module IX: Chemical kinetics • Zero, First and Second order reactions	L1, L2	3
Module X: Instrumental analysis • GC/MS, LC/MS, NMR	L1, L2, L3	1

Module XI: Colligative Properties
• Definition of colligative properties
• Different ways of expressing concentration of a solution
• Importance of colligative properties in biological systems
  • Osmosis; Osmotic pressure and its significance in cells
  • Freezing Point Depression and Cryopreservation
	L1, L2, L3	3

Module XII: Section : Inorganic Chemistry **Metals in Biological Systems** • Role of metal ions in biological processes • Metalloenzymes and metalloproteins • Oxidation state of atoms and its importance in bioavailability of micronutrients	L1, L2	2

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DBTH2739	BASICS OF RESEARCH METHODOLOGY, ETHICS, AND RESEARCH COMMUNICATION	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description

This course aims to provide students with a comprehensive understanding of conducting ethical research, utilizing proper research methodologies, and effectively communicating research findings. The course includes a final project where students will write a Literature Review on a topic chosen in consultation with the teacher(s).

This course is designed to equip students with essential skills and knowledge to conduct ethical research, employ proper research methodologies, and effectively communicate scientific information (with focus on writing a literature review). The course will cover topics such as research design, data collection and analysis, research ethics, and science communication strategies. Through a combination of lectures, discussions, case studies, and practical exercises, students will develop a deeper understanding of the research process and its ethical implications.

Course Objectives

The objective of this course is to impart knowledge about various stages of research process, research ethics and different ways of research communication.

The aim of this course is to impart research skills to the beginners and help to improve the quality of research by the existing researchers. It also encompasses the understanding and application of appropriate research design, statistics, and the use of the computer for reference management, report writing, research paper writing and presentation. The course also introduces the key conceptual issues of each research method, as well as giving practical guidance. It covers the series of research methodology contents: from problem formulation, to design, to data collection, analysis, reporting and dissemination. The course has the dual aims of equipping students with conceptual understandings of current academic debates regarding different methods, and the practical skills to put those methods into practice.

Course Outcomes

On completion of this course, the students will be able to

CO1. Define criteria of good research, steps in research process, and data collection.

CO2. Identify different types of sampling and its purpose.

CO3. Conduct hypothesis testing for different types of samples and interpret the results.

CO4: Learn the importance of literature review, write research paper/thesis, use reference management software.

Course Content :

Module	Topic	**Blooms level***	Hours
1	**Research Methodology** Understanding the research process: From research questions to conclusions	L1, L2	10

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

	Types of research: Qualitative and quantitative research Exploratory, descriptive, experimental, and correlational studies Scientific Thinking: Subjective Vs. Objective Thinking Logical Reasoning: Inductive Vs. Deductive Reasoning Formulating research hypotheses and objectives Purpose of a good research, Criteria of good research		
2	**Descriptive Statistics** Data, Types of Data, Methods of data collection, Benefits and drawbacks, Graphical representation of data and interpretation. Measures of Central Tendency: Arithmetic Mean, Median, Mode, Measures of Dispersion: Range, Standard Deviation, Variance, Coefficient of Variation.	L1, L2, L3	15
3	**Inferential Statistics** Sampling: Basic concepts, Process of Sampling, Sample Size, Types of Samples, Sampling and non- sampling errors, Statistics and Parameters, Sampling Distribution of Means and Proportion, **Hypothesis Testing**, steps in testing of hypothesis, errors in hypothesis testing, z test and t test.	L1, L2, L3	15
4	**Research Ethics** Plagiarism, Fabrication, Falsification, Ethics with respect to human and Animal Research	L1, L2	5
5	**Communication** Characteristics of a good Research paper, Systematics Literature Review (choosing a topic, preparing outline, gathering authentic & appropriate references, avoiding plagiarism, use of reference management systems), Writing a good literature review, Structure of report (Introduction, Methodology, Analysis, Results, Discussions, Conclusions, Recommendations), Writing Quality Research Paper, Publishing Research Work in Quality Journals, Reference Management Software	L1, L2, L3	15

Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4: Analysis; L5: Synthesis, L6: Evaluation

Modes of Evaluation: Quiz/Assignment/ Seminar/Written Examination

Components	A	CT	Sessional Exam	End Term Examination
Weightage (%)	5	10	15	70

Project based assignment: Student teams (2-3 students per team) will write a literature review on a topic of choice, in consultation with the teacher.

SEMESTER-VIII

Course Code: DBTH2801	DOWN STREAM PROCESSING & FERMENTATION TECHNOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course explains the processes and techniques used for production and purification of a product from culture medium. Also, bioprocess consideration in using animal and plant cell cultures will discuss using different techniques. This will also provide students with an up-to-date knowledge of upstream and downstream processing technology.

Course Objectives

The syllabus will help the students to characterize the Bioproducts of biotechnological importance and to get expertise in their downstream processing. The course shall make the students aware of various fermentation processes within the context of each topic.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Produce bio-products and secondary metabolites on commercial level using fermenters.
- Describe the production of primary and secondary metabolites.
- Recognize the fundamental understanding of physical and chemical properties of biological materials and their separation and purification.
- Explain the various principles that underlie major unit operations used in bio separations such as settling, evaporation, centrifugation, and membrane filtration.
- Explain the principles of protein precipitation, aqueous two phase extraction, adsorption and chromatography.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Fermentation Technology-An Overview • Basic principle in fermentation technology, • Media formulation and optimization, • Cell culture techniques • Inoculum development and aseptic transfers.	**L1, L3, L4, L5**	3
Module II: Bioproduct Production • Production of Ethanol, • Production of secondary metabolites – penicillin, cephalosporins, streptomycin, tetracycline, • Fermentation technology for production of acetone-butanol, citric acid, amino acids, • Polysaccharides and plastics.	**L1, L2, L3**	9
Module III: Downstream Processing-An Overview • Importance of downstream processing in biotechnology; • Characteristics of bio-products and fermentation broth	**L1, L3, L4,**	2

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module IV: Bioproduct Isolation • Separation of insoluble products - filtration, centrifugation, sedimentation, Cell disruption • Separation of soluble products: liquid-liquid extraction, precipitation	**L2, L4, L5**	14
Module V: Purification • Chromatographic techniques • Separation based on size, charge and biological affinity • Membrane Based Separation- reverse osmosis, ultra and micro filtration • Gel electrophoresis	**L3, L4, L5**	11
Module VI: Polishing • Drying; • Crystallization • Storage and packaging.	**L1, L3, L6**	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2802	INTRODUCTION TO DEVELOPMENTAL BIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

Developmental Biology is a branch of biological sciences that focuses on understanding the processes by which organisms grow and develop from a single cell (zygote) into a fully formed organism. This field integrates principles from molecular biology, genetics, and cell biology to elucidate the mechanisms that control the growth, differentiation, and morphogenesis of cells, tissues, and organs. This course introduces the students to molecular, cellular, and physiological processes that govern development in multicellular organisms. Students will examine key concepts from gamete formation, fertilization, embryonic development, repair and regeneration. Students will also explore current research topics in Stem cell engineering and Stem cell therapy.

Course Objectives

This course aims to enable the students to develop an integrated understanding of the molecular, cellular, genetic and physiological processes that govern development in multicellular organisms. Significant emphasis will be on the scientific process and key experiments that helped scientists unravel the secrets of the development processes in various model organisms.

Course Outcomes (COs):

Upon successful completion of this course students will be able to:

- Describe the different stages of development in multicellular organisms (from formation of gametes to development of a fully developed organism).
- Explain the different molecular and cellular processes involved in regulation of development in higher organisms, with suitable example
- Develop an integrated understanding of knowledge gained in fundamental courses such as genetics, cell biology and molecular biology, in the context of the various cellular, molecular and physiological processes that regulate the development of a multicellular organism.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Developmental Biology in higher organisms Life cycle and stages of development Introduction to key themes in Developmental Biology: Differential gene expression, Cell fate determination, Signalling in development, Pattern formation, Morphogenesis, Developmental plasticity: Regeneration, Apoptosis (programmed cell death)	L1, L2	7
Module II: Germ Cells and Fertilization The Benefits of Sex Reproduction in higher organisms, Primordial Germ Cells and Sex Determination in Mammals, Eggs, Sperm, Fertilization, Blastulation, Gastrulation.	L1, L2	8
Module III: Universal Mechanisms of Animal & Plant Development • Differential gene expression • Cell-Cell signalling • Cell fate determination • Patterning: axis formation and segmentation • Morphogens and morphogenesis	L1, L2, L4, L5	30

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

• Apoptosis and its role in Development • Senescence (in plants) (each of these mechanisms will be discussed with appropriate examples from the following model organisms; Caenorhabditis elegans, Drosophila, Mouse, Arabidopsis		

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2803	METHODS IN BIOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course introduces the learners to the various techniques and methods used in biology and helps them to strengthen their theoretical knowledge before practical training. This course gives an overview about the different methods used in laboratory and prepare the students for the laboratory experiments. The knowledge about the statistical methods teaches the students to interpret the data.

Course Objectives

The objective of this course is to acquaint the students with various techniques in biology. A student will build upon undergraduate level knowledge of biological principles to understand different biological techniques. The course shall also make the students aware of various statistical techniques used in biology

Course Outcomes (COs):

On completion of this course, students should be able to:

- Explain the principles of buffer preparation and function, and evaluate buffer capacities and pH adjustment for various biological experiments.
- Develop proficiency in a range of analytical techniques, such as spectrophotometry, chromatography, and electrophoresis, for the quantitative and qualitative analysis of biological molecules.
- Explain and apply microbiological methods, including culturing, isolating, and identifying microorganisms, as well as maintaining sterile techniques.
- Apply statistical methods to analyze and interpret biological data, understanding concepts such as hypothesis testing, data visualization, and the use of statistical software.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Buffers: Principle, constitution and preparation of Buffers (acidic, neutral and basic), Biological buffer systems.	**L1, L2, L3**	2
Module II: Analytical Techniques: Principle, instrumentation, applications, analysis and interpretation of the data in UV-Visible Spectrophotometry, Fluorimetry, Chromatography (Paper, TLC, Gel filtration, Ion-exchange chromatography), Electrophoresis (Gel electrophoresis, SDS-PAGE, Agarose Gel Electrophoresis, Immunoelectrophoretic techniques).	**L1, L2, L3, L4**	8
Module III: Microbiological Techniques: Culture of microorganisms; types of culture media; methods for isolating pure cultures; maintenance and preservation of pure cultures. Control of microorganisms; physical and chemical methods. Bacterial growth: definition, growth parameters, measurement of growth, synchronous growth. Batch and continuous cultures	**L1, L2, L3, L4**	7
Module IV: Biostatistics	**L1, L2, L3, L4**	7

Course Code: DBTH2804	GENETIC ENGINEERING	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBTH2805 GENETIC ENGINEERING LAB**				

Catalog Description

The objectives of this course are to teach students various approaches to conducting genetic engineering and their applications in biological research as well as in biotechnology industries. Genetic engineering is a technology that has been developed based on our fundamental understanding of the principles of molecular biology and this is reflected in the contents of this course.

Course Objectives

Given the impact of genetic engineering in modern society, the students should be endowed with strong theoretical knowledge of this technology. In conjunction with the practicals in molecular biology & genetic engineering, the students should be able to take up biological research as well as placement in the relevant biotech industry

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the fundamental principles of genetic engineering and become proficient in the tools and techniques used in genetic manipulation, such as restriction enzymes and cloning strategies.
- Explain the utility of various types of vectors, including plasmids, viral vectors, and artificial chromosomes, and their applications in gene cloning and expression.
- Discuss in detail the relevant applications of a range of PCR techniques, such as quantitative PCR, reverse transcription PCR, and digital PCR, for amplifying and analyzing DNA sequences.
- Articulate the application of gene manipulation methods and techniques for studying protein-DNA interactions, such as electrophoretic mobility shift assays (EMSAs) and chromatin immunoprecipitation (ChIP).
- Explain the principles and applications of gene silencing methods, including RNA interference, and master genome editing technologies such as CRISPR-Cas9, TALENs, and zinc finger nucleases.
- Explain the principles and applications of stem cell technology and gene therapy, focusing on their potential for treating genetic disorders and regenerative medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction and tools for genetic engineering Impact of genetic engineering in modern society; general requirements for performing a genetic engineering experiment; restriction endonucleases and methylases; DNA ligase, Klenow enzyme, T4 DNA polymerase, polynucleotide kinase, alkaline phosphatase; cohesive and blunt end ligation; linkers; adaptors; homopolymeric tailing; labelling of DNA: nick translation, random priming, radioactive and non-radioactive probes, hybridization techniques: northern, southern, south-western and far-western and colony hybridization, fluorescence in situ hybridization.	**L1, L2**	7
Module II: Different types of vectors	**L1, L2, L3**	10

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Plasmids; Bacteriophages; M13 mp vectors; PUC19 and Bluescript vectors, hagemids; Lambda vectors; Insertion and Replacement vectors; Cosmids; Artificial chromosome vectors (YACs; BACs); Principles for maximizing gene expression expression vectors; pMal; GST; pET-based vectors; Protein purification; His-tag; GST-tag; MBP-tag etc.; Intein-based vectors; Inclusion bodies; methodologies to reduce formation of inclusion bodies; mammalian expression and replicating vectors; Baculovirus and Pichia vectors system, plant based vectors, Ti and Ri as vectors, yeast vectors, shuttle vectors		
Module III: Different types of PCR techniques Principles of PCR: primer design; fidelity of thermostable enzymes; DNA polymerases; types of PCR – multiplex, nested; reverse-transcription PCR, real time PCR, touchdown PCR, hot start PCR, colony PCR, asymmetric PCR, cloning of PCR products; T-vectors; proof reading enzymes; PCR based site specific mutagenesis; PCR in molecular diagnostics; viral and bacterial detection; sequencing methods; enzymatic DNA sequencing; chemical sequencing of DNA; automated DNA sequencing; RNA sequencing; chemical synthesis of oligonucleotides; mutation detection: SSCP, DGGE, RFLP.	**L1, L2, L3**	10
Module IV: Gene manipulation and protein-DNA interaction Insertion of foreign DNA into host cells; transformation, electroporation, transfection; construction of libraries; isolation of mRNA and total RNA; reverse transcriptase and cDNA synthesis; cDNA and genomic libraries; construction of microarrays – genomic arrays, cDNA arrays and oligo arrays; study of protein-DNA interactions: electrophoretic mobility shift assay; DNase footprinting; methyl interference assay, chromatin immunoprecipitation; protein-protein interactions using yeast two-hybrid system; phage display.	**L1, L2, L3, L4**	6
Module V: Gene silencing and genome editing technologies Gene silencing techniques; introduction to siRNA; siRNA technology; Micro RNA; construction of siRNA vectors; principle and application of gene silencing; gene knockouts and gene therapy; creation of transgenic plants; debate over GM crops; introduction to methods of genetic manipulation in different model systems e.g. fruit flies (*Drosophila*), worms (*C. elegans*), frogs (Xenopus), fish (zebra fish) and chick; Transgenics - gene replacement; gene targeting; creation of transgenic and knock-out mice; disease model; introduction to genome editing by CRISPR-CAS with specific emphasis on Chinese and American clinical trials	**L3, L4, L5, L6**	7
Module VI: Stem cell and gene therapy, Types of stem cell, their use, gene therapy	**L1, L2, L3**	5

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2805	GENETIC ENGINEERING LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBTH2804 GENETIC ENGINEERING**				

Catalog Description

This course will help the students to better understand what has been taught in the theory class. Designing primers, doing PCR, cloning PCR products will make the theoretical concepts about PCR and cloning crystal clear. Further purification of recombinant proteins, running of SDS-PAGE, western blotting will be helpful for understanding the regulation of expression and understanding molecular biology techniques.

Course Objectives

The objective of this course is to give students hands on experience of the latest techniques in genetic engineering. It will also help them to understand the theoretical concepts better.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Develop the skills to design effective primers and perform PCR amplification to successfully target and amplify a gene for expression purposes.
- Acquire the ability to clone a PCR-amplified gene into an *E. coli* expression vector, including the preparation of competent cells and transformation techniques.
- Apply the principle of gene expression induction using inducers and optimize gene expression in *E. coli*.
- Gain proficiency in preparing and running SDS-PAGE gels to separate and analyze proteins, assessing the expression of the target recombinant protein.
- Master the technique of Western blotting, including transfer, blocking, antibody probing, and detection to identify and quantify the recombinant protein.
- Develop the capability to purify the recombinant protein using chromatography techniques and evaluate the purity and concentration of the final product.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Designing of primers and PCR amplification of a gene for expression	L1, L2, L3	2
Module II: Cloning of the gene in E. coli expression vector	L1, L2, L3	4
Module III: Induction of gene expression	L2, L3	2
Module IV: Running of SDS-PAGE to check expression	L1, L2, L3	2
Module V: Western blotting of the recombinant protein	L2, L3, L4	2
Module VI: Purification of the recombinant protein	L1, L2, L3, L4	3

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBTH2806	MOLECULAR DIAGNOSTICS	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

Molecular Diagnostics familiarizes students about recent advances in molecular biology and molecular medicine with a potential to profoundly alter many aspects of modern medicine including pre- or post-natal analysis of genetic diseases and identification of individuals predisposed to disease ranging from common cold to cancer. Students should be able to understand various facets of molecular procedures and basics of genomics, proteomics and metabolomics that could be employed in early diagnosis and prognosis of human diseases.

Course Objectives

Molecular Diagnosis is the process of identifying a disease by studying molecules, such as proteins, DNA, and RNA, in a tissue or fluid. It is a new discipline that captures genomic and proteomic expression patterns and uses the information to distinguish between two or more conditions at the molecular level. The conditions under investigation can be human genetic disease or infectious diseases. Molecular diagnostics is not confined to human diseases but can be used in animals or plants

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the significance of the classical discoveries in Molecular Diagnostics, and explain the uses of the same in modern context
- Compare the modern-day Molecular Diagnostic technologies with the technologies used earlier, and explain their significance in the modern advancements.
- Describe the key uses of Molecular Diagnostics tests in microbial diseases, metabolic pathway impairments and paediatric diseases.
- Explain the role of DNA mutations, polymorphisms and chromosomal abnormalities in diseases and how Molecular Diagnostic tests can identify these.
- Recognise the impact of Molecular Diagnostic tests in rapid, easy, high throughput disease diagnostics
- Enlist and explain the ever-increasing list of Molecular Diagnostics applications in biotechnology, precision medicine and prenatal diagnostics.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Molecular Diagnostics. Genome biology in health and disease DNA, RNA, Protein: chromosomal structure & mutations; DNA polymorphism: human identity; clinical variability and genetically determined adverse reactions to drugs.	**L1, L2, L3**	5
Module II: Techniques used: Hybridization based techniques, Southern, Western, FISH, PCR, PCR based techniques, RT-PCR, Multiplex, DNA fingerprinting, sequencing, new generation sequencing, RNA sequencing, Microarray, Bioinformatics data acquisition & analysis.	**L1, L2, L3**	5
Module III: Diagnostic metabolomics Metabolite profile for biomarker detection the body fluids/tissues in various metabolic disorders by making using LC MS & NMR technological platforms.	**L3, L4, L5**	5

Prof. (Dr.) Anil Kumar

Course Code: DBTH2807	ENVIRONMENTAL BIOTECHNOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Ecology and Environment				
Co-requisites	Nil				

Catalog Description

Environmental Biotechnology" offers an in-depth exploration of how biotechnological methods can address pressing environmental challenges. This course equips students with the knowledge and skills to develop innovative biotechnological solutions for a sustainable future

Course Objectives

The course "Environmental Biotechnology" aims to provide students with a comprehensive understanding of the intersection between biotechnology and environmental science. Through six detailed modules, students will explore critical environmental issues, the development and use of bioenergy resources, and the methods for pollution control and waste treatment. They will gain expertise in bioremediation and biodegradation techniques, which utilize biological systems to address environmental contaminants. The course will also emphasize green practices for sustainable development, encouraging the adoption of eco-friendly technologies and strategies. Additionally, students will examine environmental protection policies, understanding their role in promoting sustainability and conserving natural resources.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand and articulate the major environmental issues, including pollution, climate change, and biodiversity loss, and their impact on ecosystems and human health.
- Analyse various bioenergy resources, such as biofuels and biomass, and evaluate their potential and challenges in replacing fossil fuels.
- Develop an understanding of different types of pollution and waste, and explain the principles and techniques for effective waste treatment and pollution control.
- Discuss bioremediation and biodegradation processes, and apply microbial and plant-based strategies to detoxify and restore contaminated environments.
- Explore and assess green practices and technologies aimed at promoting sustainable development, reducing environmental impact, and conserving natural resources.
- Understand the key environmental protection policies and regulations, and evaluate their effectiveness in safeguarding the environment and promoting sustainable practices.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Environmental issues Greenhouse effect, Global Warming, Global Ozone Problem, Acid Rain, Eutrophication and Biomagnification	L1, L2, L3	3
Module II: Bioenergy Resources Renewable and Non-Renewable energy resources Clean fuel technology and generations of Biofuels- Bioethanol, Biogas, Biodiesel, Algal fuels.	L1, L2, L3	6
Module III: Pollutions & Waste treatment Pollutions:- Air, Water & Soil, Classification and characterization of waste, Principles & Mechanisms of Waste Water Engineering: Treatment of municipal	L3, L4, L5	7

DBTH2839	DATA ANALYSIS & VISUALISATION USING SOFTWARE	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	Class X Mathematics				
Co-requisites					

Catalog Description

The implosion of available data has made visualization more critical but also more challenging. Data analysis and Data Visualization are essential tools for business analysis, engineers, policymakers, and decision-makers. Developed originally for "small data", visualization techniques have been met with varied success in the past centuries and decades. There are a few well-known visualizations that are very effective in capturing the essence of the data, and of course, there are many infamous negative examples of poor visuals. An effective visual is critical for decision making it, but it also requires a lot of work, customization, attention to detail, and refinements.

Course Objectives

The course is designed to help students develop skills and knowledge in the following area(s):

- Develop an understanding of what is a good visualization for a given purpose
- Learn visualization theory & techniques
- Build a substantial data analytic project
- Apply data analysis and visualization with Excel, SPSS, R, Python, NVivo and MATLAB

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will be able to articulate meaningful lines of inquiry that might be explored through the collection, organization, visualization, and analysis of data in a context associated with their primary field of study using (as appropriate) numerical, textual, spatial, and/ or visual data.

CO2. Student will understand what data are, how they are collected, and how to assess the quality/ reliability of data.

CO3. Students will demonstrate intermediate proficiency in the visualization of data to communicate information and patterns that exist in the data.

CO4: Students will be able to use at beginning level of proficiency the tools of statistics and machine learning to ask questions of and explore patterns in data.

Course Content :

Module	Topics Covered	Blooms Level	Contact Hours
1	**Module-1: Introduction to Excel** Data Analysis using Excel, Curve fitting, Correlation, Linear Regression, Multiple regression, Principal Component Analysis and Factor Analysis, Hypothesis testing **Introduction to Excel and SPSS**	L1, L2, L3, L4	20 hours

About the Program

The BSc Biological Sciences undergraduate program is designed to provide a comprehensive understanding of the biological sciences, fostering a solid foundation in various disciplines such as botany, zoology, microbiology, genetics, and biotechnology. The program's goals are to equip students with critical thinking skills, practical laboratory experience, and an in-depth knowledge of biological systems and processes. Graduates will be prepared for diverse career opportunities in research, healthcare, environmental conservation, and biotechnology industries, as well as for higher education and specialized professional courses.

Aligned with the National Education Policy (NEP) 2020 of India, the program emphasizes multidisciplinary and holistic education, integrating flexible curricula, and innovative pedagogies to promote lifelong learning and critical inquiry. The curriculum is designed to encourage experiential learning through internships, fieldwork, and project-based assignments. It also promotes the development of ethical values and a scientific temper, preparing students to contribute effectively to societal and global challenges. This alignment ensures that the program remains relevant, dynamic, and responsive to the evolving needs of society and the job market. The table below states Amity University Haryana's key objectives, Amity Institute of Biotechnology's Objectives for the UG program (Program Objectives, PO) and the Program Specific Objectives, PSO, for the BSc Biological Sciences program, all in line with the NEP. The POs and PSOs form the foundation principles based on which the program structure and the curriculum for each course is designed. The course content for each course is duly mapped to the POs and PSOs.

	AUH Key Objectives (based on NEP)	AIB Objectives (PO)	BSc BLS objective (PSO)
1	Multidisciplinary Learning and Holistic Education	To impart a comprehensive understanding of core subjects in Life Sciences along with a strong foundation in allied disciplines such as chemistry, physics, and computational and mathematical tools.	To impart a comprehensive understanding of core subjects in Biological Sciences along with a strong foundation in allied disciplines such as chemistry, physics, and computational and mathematical tools.
2	Experiential and Hands-on Learning	To empower the students with the technical knowledge and skills for executing experiments in Life Sciences, with focus on experimental design, use of modern experimental equipment, qualitative and quantitative data collection, critical thinking and analysis, in order to make them skilled for career opportunities.	To empower the students with the technical knowledge and skills for executing experiments in Biological Sciences, with focus on Experimental Design, use of modern experimental equipment, qualitative and quantitative data collection Critical Thinking and analysis, in order to make them skilled for career opportunities.
3	Research and Innovation	To inculcate a spirit of scholarly research, innovation and entrepreneurship in Life Sciences	To inculcate a spirit of scholarly research, innovation and entrepreneurship in Life Sciences
4	Ethics and Sustainability	To instil ethical practices and an understanding of sustainable development in the context of issues related to Life Sciences	To instil ethical practices and an understanding of sustainable development in the context of issues related to Life Sciences

5	Communication and Collaboration	To improve scientific communication skills through various medias, and the ability to work collaboratively in multidisciplinary teams	To improve scientific communication skills through various medias, and the ability to work collaboratively in multidisciplinary teams
6	Lifelong Learning and Adaptability	To nurture a mindset of continuous education and professional development, by encouraging a quest for knowledge and personal growth.	To nurture a mindset of continuous education and professional development, by encouraging a quest for knowledge and personal growth.

A salient feature of the NEP is the emphasis on providing the students opportunities for multidisciplinary learning, practical real-life experience, and a all-rounded personal development. This is implemented through offering various baskets of courses as follows. Students will learn the subjects in their chosen major through the basket of courses offered under Discipline Specific Courses (DSC I). In addition, two more baskets of courses DSC-II and DSC-III (often referred to as D2 and D3 courses respectively). The D2 basket includes courses that are offered by a program different from the on the student has registered as the Major program but within the same Faculty. The D3 basket includes courses that are offered by a program different from the one the student has registered as the Major program and outside the Faculty. (Amity University Haryana has the following 6 Faculties: 1. Faculty of Science Engineering and Technology, 2. Faculty of Health and Allied Sciences, 3.Faculty of Arts, 4. Faculty of Management Studies & Behavioural Sciences, 5. Faculty of Architecture and Planning, and 6. Faculty of Law. Amity Institute of Biotechnology comes under the Faculty of Science Engineering and Technology).

In addition, the Skill Enhancement courses, Ability Enhancement courses and Value Added courses further diversify the scope of student's learning in order to empower them for a wholistic development.

SEMESTER-I

Course Code: DBLS2101	PLANT DIVERSITY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites					
Co-requisites	**DBLS2102 PLANT DIVERSITY LAB**				

Catalog Description

This undergraduate course on Plant Diversity explores the vast array of plant life, from algae and mosses to ferns, gymnosperms, and angiosperms. Students will study plant classification, evolutionary relationships, ecological roles, and adaptations to different environments. Students will gain a comprehensive understanding of plant morphology, physiology, and taxonomy, preparing them for advanced studies and careers in botany, ecology, environmental science and biotechnology.

Course Objectives

This course aims to provide undergraduate students with a thorough understanding of plant diversity, encompassing the classification, evolution, and ecological significance of various plant groups. Students will learn to identify and characterize different plant species, understand their physiological and morphological adaptations, and appreciate their roles in ecosystems. The course prepares students for advanced studies and careers in botany, ecology, conservation, environmental science, and biotechnology.

Course Outcomes (COs):

- Describe the importance and scope of plant diversity, including the major plant groups
- Identify and classify various algae and bryophytes, explaining their life cycles, ecological roles, and economic importance.
- Distinguish between pteridophytes and gymnosperms, understanding their morphological characteristics, reproductive strategies, and ecological significance.
- Classify and describe the structural features, reproductive mechanisms, and ecological roles of key angiosperm families such as *Cucurbitaceae, Apiaceae, Apocynaceae, Asclepiadaceae, Lamiaceae, Euphorbiaceae,* and *Poaceae*.
- Analyze the significance of biodiversity in providing ecosystem services, supporting agriculture, and promoting sustainable practices in both rural and urban environments.
- Evaluate the various threats to biodiversity, including habitat loss, invasive species, pollution, climate change, and human activities, and propose conservation strategies to mitigate these impacts.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Plant Diversity • Introduction to Whittaker's five-kingdom system of classification • Overview of plant diversity and its significance • Increasing complexity: From algae to angiosperms • Basic principles of plant taxonomy and classification Major plant groups and their characteristics	L1, L2, L3	6
Module II: Algae and Bryophytes • Characteristics and classification of algae • Ecological roles and economic importance of algae • Characteristics and classification of bryophytes	L1, L2, L3, L5	8

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana

• Life cycle and reproduction of bryophytes		
Module III: Pteridophytes and Gymnosperms • Characteristics and classification of pteridophytes • Life cycle, reproduction, and ecological roles of pteridophytes • Characteristics and classification of gymnosperms • Life cycle, reproduction, and economic importance of gymnosperms	L1, L2, L3, L4, L5	8
Module IV: Angiosperms • Overview of angiosperms and their significance • Classification of angiosperms: Monocots vs. dicots • Structural features: Roots, stems, leaves, flowers, fruits, and seeds • Pollination, fertilization, and seed dispersal mechanisms • Representative Families of interest: *Cucurbitaceae*, *Apiaceae, Apocynaceae, Asclepiadaceae, Lamiaceae, Euphorbiaceae,* and *Poaceae* • Economic and Ethnobotanical importance of plants	L1, L2, L3, L4, L5, L6	10
Module V: Why is Biodiversity conservation important? • Biodiversity and ecosystem services • Medicinal plants and natural products • Agrobiodiversity and crop diversity • The role of pollinators in agriculture • Sustainable agriculture and biodiversity conservation • Urban Biodiversity: Biodiversity in urban environments • Green spaces and urban biodiversity conservation (pros and cons of Miyawaki forests)	L1, L2, L3, L4, L5, L6	7
Module VI: Threats to Biodiversity • Habitat loss and fragmentation • Invasive species and their impacts • Pollution and climate change effects on biodiversity • Effect of Monoculture on Biodiversity • Role of Biotechnology in Monoculture. • Human impacts on plant diversity and conservation strategies	L1, L2, L3	6

Course Code: DBLS2102	PLANT DIVERSITY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2101 PLANT DIVERSITY**				

Catalog Description

The Plant Diversity Lab course offers hands-on experience in studying the vast array of plant species, from simple algae to complex angiosperms. Students will engage in laboratory and fieldwork to observe, identify, and classify plants, examining their morphological and anatomical features. Emphasis is placed on understanding plant evolution, ecological roles, and adaptations. This lab course complements theoretical knowledge from lectures, providing practical skills essential for careers in botany, ecology, and environmental science.

Course Objectives

The objective of the Plant Diversity Lab course is to provide students with practical skills and hands-on experience in identifying, classifying, and studying various plant species. Through laboratory exercises and fieldwork, students will explore the morphological and anatomical features of plants and recognize their ecological roles. This course aims to enhance students' observational and analytical abilities, preparing them for advanced studies and careers in botany, ecology, and environmental science.

Course Outcomes (COs):

Upon successful completion of this course, students will be able to:

- Proficiently use microscopy techniques to prepare and observe various plant specimens.
- Microscopically examine and prepare temporary slides of algae, fungi, bryophytes, mosses, lichens, mycorrhiza, and pteridophytes, identifying their vegetative and reproductive structures.
- Gain the skills to study gymnosperms, specifically Cycas and Pinus, through permanent slides and temporary preparations, understanding their structure and reproductive features.
- Describe, identify, and characterize the floral structures and economic importance of representative angiosperm families such as *Cucurbitaceae, Apiaceae, Apocynaceae, Asclepiadaceae, Lamiaceae, Euphorbiaceae,* and *Poaceae.*
- Conduct field studies to understand the role of biodiversity in ecosystem services,
- Identify invasive plant species and evaluate their impact on native flora, as well as analyze the effects of pollution on plant diversity.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Microscopy and Plant Specimen Handling • Learning basic microscopy techniques • Preparing and observing plant specimens	L1, L2, L3	2
Module II: Cryptogams • Microscopic study Algae of C*hlamydomonas, Volvox, Spirogyra,* (Fresh preparations and permanent slides). • Temporary microscopic slide preparation of Bryophytes, Mosses, Lichens, Mycorrhiza, Pteridophytes; observation of vegetative and reproductive structures.	L1, L2, L3, L4	6

Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2104 ANIMAL DIVERSITY LAB**				

Catalog Description

This course explores the fundamental principles of classification with a focus on animal structure and function. Students will begin by learning the basics of animal diversity, which will build a foundation for progressively deeper understanding of the subject. This knowledge will also highlight its applications in biotechnology and industry

Course Objectives

The aim of this course is to familiarize students with the details of animal classification and diversity, providing a solid foundation for future studies and research in biotechnology

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall the landmark concepts in animal diversity, and explain the different classifications of microorganisms
- Explain the evolutionary relationship between different animals, and its significance in taxonomy
- Describe and understand the identification and classification of organisms using traditional and modern methods
- Explain and gain fundamental knowledge of Animal Diversity
- Recognize the impact of animals in ecological balance
- Enlist and explain the concept of species and binomial nomenclature

Course Content:

Modules	Blooms level*	Number of hours
Module I: General Account Introduction to Whittaker's five-kingdom system of classification; General accounts of animal diversity, theory of evolution and classification of animals, concept of species, binomial nomenclature, evolutionary relationship among three domains of life- Archaea, Bacteria and Eukaryotes. Model animals as research tool.	L1, L2, L3	15
Module II: Invertebrates General characteristics of Protozoa, Porifera, Coelenterates, Helminths, Annelida, Arthropoda, Mollusca, Echinodermata, classification up to classes. Amoeba as a model to study protozoan characters, Sycon as a model to study poriferan characters, Study of canal system and spicule formation among sponges, Hydra as a model to study morphology, anatomy, locomotion and reproduction of Coelenterates, Tapeworm as a model to study life-cycle and parasitism of Helminths, Earth worm as a model to study morphology, anatomy, nervous system, locomotion, reproduction and physiology of Annelida, Arthropoda morphology, appendages, metamorphosis, Starfish as a model to study life cycle, respiration, nervous	L1, L2, L3, L4	15

Manesar Gurgaon-122413

system, circulation, excretion and vascular system of Echinodermata.		
Module III: Vertebrates General characters and classification of Chordata, Protochordates, Urochordates, Cephalochordates, Cyclostomes. Fishes, Amphibians, Reptiles, Birds, Mammals. Parental care in amphibian, reptiles, Aves and mammals. Homeostasis and Thermoregulation in invertebrates and vertebrates.	L1, L2, L3, L4, L6	15

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2104	ANIMAL DIVERSITY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2103 ANIMAL DIVERSITY**				

Catalog Description

This laboratory course complements the theory course Animal Diversity. In this course students will explore the diversity of invertebrate & vertebrate animals, and identify specimens & permanent slides. They will also engage in model-based demonstration of the different organ systems including circulatory, digestive, respiratory and reproductive systems of vertebrate animals.

Course Objectives

The goal of this course is to acquaint the students with the diversity of animals and familiarise with their distinct physiological features. Identification of permanent slides & preserved specimens, and model-based demonstration of different organ systems of vertebrate animals will act as an excellent basis for further biological studies and research.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Explain the basis of animal classification and identify a few organisms belonging to different taxa.
- Describe the various organ systems in different vertebrates using models.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Methods of Sterilization Physical and Chemical methods	L1, L2, L3	2
Module II: Temporary mount of human cheek cells	L1, L2, L3	2
Module III: Spot Identification: Permanent slides of Earthworm Gizzard and Intestine	L1, L2, L3	2
Module IV: Spot Identification: *Amphioxus, Balanoglossus*	L1, L2, L3	2
Module V: Spot Identification: Permanent slides of Fish scales	L1, L2, L3	2
Module VI: Spot Identification: *Scoliodon, Trygon, Exocoetus*	L1, L2, L3	2
Module VII: Demonstration: Branchial system of *Scoliodon*	L1, L2, L3	2
Module VIII: Demonstration: Digestive system of *Bufo*	L1, L2, L3	2
Module IX: Demonstration: Air sacs of *Columba*	L1, L2, L3	2
Module X: Demonstration: Reproductive system of male and female *Rattus*	L1, L2, L3	2

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

SEMESTER-II

Course Code: DBLS2201	PLANT ANATOMY AND PHYSIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2202 PLANT ANATOMY AND PHYSIOLOGY LAB**				

Catalog Description

This fundamental course, "Plant Anatomy and Physiology" introduces the undergraduate students to the structure and function of plants. It covers cellular organization, tissue systems, and organ functions. Students learn about plant structure (anatomy and morphology), plant growth, development, and adaptation mechanisms. Key topics include photosynthesis, respiration, hormonal regulation of growth, development and adaptation to different kinds of stress, water transport, and nutrient uptake. Emphasis will be placed on the relationship between structure and function, as well as the adaptation of plants to their environments.

Course Objectives

This course aims to impart to students fundamental knowledge and understanding about plant form, function, development and metabolism. A strong understanding of this basic knowledge will prepare the students for a diverse range of career options including cultivation of plants and crop improvement by traditional methods and modern biological tools and application. This knowledge will also equip the students to develop solutions to address key global issues such as Climate change.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Identify plant vegetative and reproductive structures
- Correlate the form and function: correlation of different morphological and anatomical adaptations.
- Understand the detailed anatomy of plant cells, tissues, and organs.
- Explain the physiological mechanisms, processes underlying plant growth and development.
- Analyze the processes of photosynthesis, respiration, and water and nutrient transport.
- Evaluate the morphological, physiological and metabolic adaptive strategies of plants in different environments.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Plant Anatomy and Physiology • Overview of plant structure and function • Importance of studying plant anatomy and physiology in agriculture and ecology	L1, L2, L3	2
Module II: Plant Cells and Tissues • Plant Cell • Primary & Secondary cell wall, Plasmodesmata and pits • Meristems • Cell types and their functions • Tissue systems: dermal, ground, and vascular tissues • Root, Shoot and Leaf anatomy (one typical example each from Monocot and Dicot)	L1, L2, L3, L4	10
Module III: Plant Growth and Development • Plant growth processes	L1, L2, L3	10

Prof. (Dr.) Anil Kumar

Manesar Gurgaon-122413

• Hormonal regulation of plant growth • Abscission and healing of wounds (in brief)		
Module IV: Water Transport and Nutrient Uptake • Plant water relations • Mineral nutrient uptake and transport in plants • Nitrogen availability • Adaptations for water conservation and nutrient acquisition	L1, L2, L3	8
Module V: Photosynthesis and Respiration • Mechanisms of photosynthesis (C3, C4 & CAM) • CAM anatomy • Photorespiration (in brief) • Cellular respiration in plants (in brief)	L1, L2	10
Module VI: Plant Reproduction • Pollination and fertilization processes • Seed development and dispersal	L1, L2, L3	5

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2202	PLANT ANATOMY AND PHYSIOLOGY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2201 PLANT ANATOMY AND PHYSIOLOGY**				

Catalog Description

This course, "Plant Anatomy and Physiology Lab" complements the theory course "Plant Anatomy and Physiology" (DBLS2201). In this course students will gain hands-on experience in investigating anatomy of different parts of plants, familiarize themselves with different experimental tools and techniques. Study and discussions on case studies will empower them to analyse issue or global concern.

Course Objectives

This course will engage the students in practical experiments to understand the intricate structures and physiological processes that govern plant life. From microscopy techniques unveiling cellular details to experiments elucidating growth patterns and responses to environmental stimuli, this lab experience provides a practical foundation in the fundamental principles of plant anatomy and physiology.

Course Outcomes (COs):

- Demonstrate proficiency in staining and microscopic techniques
- Understand the organization of the root meristem
- Compare and contrast anatomical features of root, stem and leaf samples between monocots and dicots. Also examine structure anatomy of floral parts.
- Classify leaf types (simple, compound) and phyllotaxy patterns
- Comprehend water utilization and soil fertilization practices in organic cultivation
- Examine floral parts and the cross-section of the ovary.
- Critically analyze local and international examples, demonstrating an understanding of the impact of climate change on agriculture.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Staining and Microscopic techniques for studying plant cells and tissues	L1, L2, L3	2
Module II: Root meristem • Onion root tip	L1, L2, L3	2
Module III: Root anatomy • CS of dicot root	L1, L2, L3	2
Module IV: Root anatomy • CS of monocot root	L1, L2, L3	2
Module V: Stem anatomy • Monocot stem & Dicot stem	L1, L2, L3	2
Module VI: Leaf anatomy • Monocot leaf and Dicot leaf	L1, L2, L3	2
Module VII: Field observation • Leaf types (simple, compound); Phyllotaxy; Secondary growth in trees and shrubs	L1, L2, L3, L4	4

Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2204 ANIMAL ANATOMY AND PHYSIOLOGY LAB**				

Catalog Description

Studying animal physiology as part of a bachelor's degree curriculum can be both fascinating and foundational for understanding of the physiological processes in animals, including how different organ systems function and interact. In this course the students will learn how animals acquire nutrients from food, the basics of circulatory system, the physiology of muscle contraction and how animals coordinate responses to stimuli through nervous impulses.

Course Objectives

The main objective of this course is to provide the knowledge about Animal Anatomy & Physiology. This course will provide a robust foundation in biological sciences and the knowledge can be utilized for understanding real-world applications and current research in Animal Anatomy & Physiology.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall fundamental Animal Anatomy & Physiology processes.
- Demonstrate the structure and function of major organ systems in animals, including the digestive, circulatory, nervous and muscular systems.
- Illustrate the biochemical processes underlying the physiological functions in animals.
- Correlate the structure of cells, tissues, organs, and systems with their physiological functions in animals.
- Analyse physiological processes and solve problems related to animal physiology.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Lymphatic system, respiratory system, urinary system, and reproductive system	L1, L2, L3	10
Module II: Nervous and endocrine system and their role in the maintenance of homeostasis	L1, L2, L3	10
Module III: Composition and function of saliva; Mechanical and chemical digestion; Functions of pancreatic juices and biles. Blood, Blood Groups and Blood Transfusion; Blood Clotting; Hemodynamics; Cardiac Cycle and its regulation	L1, L3, L4	15
Module IV: Contraction and relaxation of muscle; Sarcomere; Cori's cycle. Organization of Nervous System; Neuron, nerve impulse; Synaptic Transmission; Neurotransmitters	L1, L3, L4	10

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2203 ANIMAL ANATOMY AND PHYSIOLOGY**				

Catalog Description

This laboratory course is designed to complement the theoretical knowledge gained in Animal Anatomy and Physiology courses. It provides hands-on experience with various biochemical and microscopic techniques used in the study of Animal Anatomy and Physiological processes.

Course Objectives

The main objective of this course is integration of theoretical knowledge with practical application, enabling students to connect anatomical structures with physiological functions. By conducting experiments and analyzing data collected during lab sessions, students will learn how to interpret physiological data and draw meaningful conclusions.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall basic principles of Anatomy and Physiology
- Demonstrate proficiency in laboratory techniques relevant to animal anatomy and physiology, such as microscopy, histology (study of tissues), and physiological experimentation.
- Enhance critical thinking skills by analysing anatomical variations and relating anatomical structures to physiological functions.
- Identify the ethical considerations related to animal research and experimentation, including proper care and handling of specimens and respect for animal life.
- Apply knowledge gained in the lab to real-world scenarios, such as understanding the impact of diseases or injuries on anatomical structures and physiological functions.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Study of permanent slides (mammalian tissues) • T. S. of Liver • T.S. of Kidney • T. S. of Testis • T.S. of Heart • T.S. of Spleen	L1, L2, L3	10
Module II: • Enumeration of red blood cells using hemocytometer. • Enumeration of total and differential count of white blood cells.	L2, L3. L4	8
Module III: • Effect of pH on amylase activity from saliva. • Biochemical analysis: carbohydrate, proteins and fats**.**	L1, L3,	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

SEMESTER-III

Course Code: DBLS2301	BIOCHEMISTRY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2302 BIOCHEMISTRY LAB**				

Catalog Description
This course aims to provide a comprehensive understanding of the biochemical principles that govern cellular processes. The course covers the chemical basis of life, focusing on the structure, function, and metabolism of biological molecules such as amino acids and proteins, nucleic acids, lipids, and carbohydrates.

Course Objectives
This course will cover the general properties of all biomolecules, their metabolism and practical approaches to study the same. This will provide a basic understanding of all the essential biochemical species necessary for life.

Course Outcomes (COs):
On completion of the course, the students will be able to:

- Explain the basic principles of biochemistry, and physical and chemical properties of all biomolecules.
- Describe how the biomolecules are metabolized.
- Relate how the structure of biomolecules influences their function and overall cellular homeostasis.
- Propose experiments for quantitative and qualitative analysis of biomolecules.
- Sketch the chemical structures of various biomolecules.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Basic principles • Mole concept, Properties of water; acids, bases and buffers; covalent and non-covalent interactions in biological systems; • Bioenergetics; General understanding of metabolic pathways and principles • Overview of Macromolecules: Proteins, Carbohydrates, Lipids & Nucleic acids – their building blocks, structure, diverse functions in biological system.	L2, L3, L4	4
Module II: Amino acids • Classification, chemical and physical properties • Transamination reaction • Biosynthesis and breakdown of amino acids using few representative examples. • Role of essential proteases and their target sites. • Urea cycle	L1, L2, L3	6
Module III: Proteins • Structural levels of proteins • Nature of peptide bond, phi and psi angles • Types of secondary structural elements - alpha helix, beta conformation, beta turns, Ramachandran plot and its importance • Enzymes: Introduction to kinetic and catalytic mechanisms;	L1, L2, L3, L6	10

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

• Regulation of enzyme activity; types of enzyme inhibition.		
Module IV: Carbohydrates • Sugars and Polysaccharides • Carbohydrate metabolism: glycolysis and its regulation • Citric acid cycle and its regulation • Amphibolic nature of Citric acid cycle • Electron transport System • Oxidative phosphorylation and ATP production • Gluconeogenesis • Pentose phosphate pathway	L1, L4, L5	11
Module V: Lipids • Classification, structure and function • Lipids and biological membranes • Lipoproteins • Phospholipids • Sphingolipids • Glycolipids • Fatty acid metabolism: β-oxidation, biosynthesis and regulation; ketone bodies	L1, L2, L4	8
Module VI: Nucleic Acids • Nitrogenous bases • Nucleotides • Structure and properties of nucleic acids • Nucleotide Metabolism: metabolism of purines and pyrimidines	L1, L2	**6**

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2302	BIOCHEMISTRY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2301 BIOCHEMISTRY**				

Catalog Description

This is a laboratory course focusing on the development of intermediate laboratory skills in modern biochemistry using the context of experiments examining biologically relevant molecules. This course is designed to foster skills in proper laboratory practice and record keeping, the use of biochemical instrumentation, the proper interpretation of experimental results, and the effective communication of the results through written reports. This course will provide both a theoretical and practical understanding of basic biochemical methods including the isolation, purification and characterization of proteins, lipids and DNA. Database applications for biotechnological applications will also be discussed.

Course Objectives

The laboratory experiments in Biochemistry would allow the students to get a practical exposure to the properties of biomolecules studied in the course.

Course Outcomes (COs):

CO1: At the end of the course, student will be able to detect, quantitate and analyse various biomolecules.
CO2: They will also learn the associated analytical tools required in the process.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Preparation of buffers useful for biological experiments	L1, L2, L3	4
Module II: Construction of standard plots using graph sheet and MS- Excel	L1, L2, L3	4
Module III: Detection of the presence of amino acids using Ninhydrin Test	L1, L2, L3	2
Module IV: Detection and quantitation of proteins using Bradford test	L1, L2, L3	4
Module V: Colorimetric detection of sugars (Molisch test, Fehling's test, Seliwanoff test)	L1, L2, L3	4
Module VI: Ethanol emulsion test to detect the presence of lipids	L1, L2, L3	4
Module VII: Biochemical estimation of DNA and RNA, Quantitative determination of DNA and RNA by UV spectrophotometer, Determination of purity of nucleic acids, Determination of melting temperature of DNA from thermal denaturation characteristics	L1, L2, L3	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2303	MOLECULAR BIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2304 MOLECULAR BIOLOGY LAB**				

Catalog Description

Molecular biology is the branch of Biology that deals with structure and function of macromolecules essential to life. A course in Molecular Biology should enable the students to understand how 1) the genetic material is passed on from one generation to the next and 2) how the genetic material is expressed and regulates the functioning of the cell.

Course Objectives

The objective of the course is to provide a clear understanding of the basic molecules inside the cell that govern the fundamental processes of life i.e. DNA, RNA and proteins. The structure of these molecules provides important clues to their functions. In addition, DNA being the genetic material in most organisms, studies regarding basic tools and techniques to manipulate it are covered in the syllabus. Strong foundation in molecular biology enables the students to familiarize themselves with basic mechanisms of genes, DNA replication and Gene expression in health and disease.

Course Outcomes (COs):

On completion of this course, students should be able to:

1. Understand and conceptualize the landmark discoveries in Molecular Biology, and their role in furthering our knowledge about the subject.
2. Explain the basic structure of biomolecules and the structure-function relationship within the cell and their role in bringing about the daily physiological functions.
3. Describe the key metabolic processes about their replication, gene expression and protein synthesis and illustrate the similarities and differences between the structure and function of DNA and RNA and their role in origin of life.
4. Explain the principle of central dogma in Molecular Biology; illustrate the principles of positive and negative regulation of gene expression.
5. Recognize the impact of gene mutations or changes in gene sequence and ways to repair them and their role in disease and evolution.
6. Enlist and explain the role of molecular biology in health, diagnostics, recombinant DNA technology, food production, and precision medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Historical developments in genetics leading to evolution of molecular biology. Historical experiments that led to identification of DNA as the genetic material, structure of DNA and RNA, complementarity, phosphodiester bond, different types of DNA, denaturation and reassociation.	**L1, L2, L3**	7
Module II: DNA replication, replication origin, theta structure, DNA polymerases, modes of replication, mechanism of replication in *E.coli*, synthesis of leading and lagging strands, DNA replication in eukaryotes. DNA repair, mutations, DNA damage, Photoreactivation, Base excision repair, mismatch repair, Nucleotide excision repair.	**L1, L2, L3**	8

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module III: Genome organization in prokaryotes and eukaryotes, genes and pseudogenes, repeated sequences. Transposable elements – transposons, Chromosome structure: heterochromatin, euchromatin, histone proteins, histone code. Chromosomal rearrangements, aneuploidy, chromosomal human disorders.	**L3, L4, L5**	6
Module IV: Transcription: Gene structure: promoter and coding sequences, regulatory and transcription units, RNA polymerases, basic mechanism of transcription (initiation, elongation and termination) in prokaryotes and eukaryotes, tRNAs, rRNA, microRNA and long noncoding RNA	**L3, L4, L5**	7
Module V: Deciphering the genetic code, Salient features of genetic code, Translation – initiation, elongation and termination, Regulation of gene expression, Prokaryotes negative and positive regulation, attenuation, Eukaryotes: Transcription factors, activators and enhancers.	**L3, L4, L5, L6**	7
Module VI: Molecular Biology Techniques: DNA foot printing, Radioactivity, Polymerase Chain reaction, Hybridization, siRNA, EMSA, CRISPR-CAS technique	**L1, L2, L3**	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2304	MOLECULAR BIOLOGY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2303 MOLECULAR BIOLOGY**				

Catalog Description

The laboratory course consists of Molecular Biology experiments organized in different learning modules and lectures relevant to the experiments. These provide hands on training and in-depth knowledge about methods like isolation, purification, and detection of recombinant DNA and proteins; polymerase chain reaction, its use in diagnosis, cloning and recombinant DNA technology, quantification of denatured DNA and gene expression analysis. The students will learn the basics of experimental design, data analysis, and presenting the report in the lab record book.

Course Objectives

The goal of this course is to familiarize students with Molecular Biology techniques so that they can get absorbed easily in research jobs.

Course Outcomes (COs):

- Acquire a working knowledge of methods in Molecular Biology.
- The student should be able to use standard laboratory equipment and methods frequently used in Molecular Biology research.
- Understand and be able to perform simple data analysis (including statistics) and interpret the results generated.
- To communicate their results in written and oral form.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Isolation of Genomic DNA from E. Coli.	**L1, L2, L3**	3
Module II: Qualitative analysis of Genomic DNA by Agarose Gel Electrophoresis	**L1, L2, L3**	2
Module III: Quantitative analysis of DNA by spectrophotometer	**L3, L4, L5**	2
Module IV: Isolation of Plasmid DNA	**L3, L4, L5**	3
Module V: Restriction enzyme digestion	**L3, L4, L5, L6**	3
Module VI: Competent cell preparation	**L1, L2, L3**	4
Module VII: PCR	**L1, L2, L3, L4**	4
Module VIII: Gel extraction of fragments	**L1, L2, L3**	3
Module IX: Ligation and cloning of insert	**L1, L2, L3, L4, L5**	3

SEMESTER-IV

Course Code: DBLS2401	MICROBIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Biology				
Co-requisites	**DBLS2402 MICROBIOLOGY LAB**				

Catalog Description
Microbiology is aimed at introducing the world of microorganisms, including bacteria, viruses, fungi, and protozoa. This course covers the fundamental principles of microbiology, emphasizing microbial structure, function, metabolism, genetics, growth, control of microorganisms and ecology. Beginners of the course are rightly exposed to the foundation of microbiology, which would lead them towards progressive advancement of the subject as well as their applications in biotechnology and industry.

Course Objectives
To acquaint the students about the basics of microbiology, various techniques for their cultivation and control, and role of various microorganisms in different biotechnological applications.

Course Outcomes (COs):
On completion of this course, students should be able to:

- Recall the landmark discoveries in Microbiology, and explain the different classifications of microorganisms
- Explain the evolutionary relationship between different microorganisms, and its significance in microbial taxonomy.
- Describe the key metabolic pathways in microorganisms; illustrate their significance in determining the nutrient requirement and growth of microorganisms.
- Explain the principles of microbial genetics and central dogma in microorganisms; illustrate the principles of positive and negative regulation of gene expression.
- Recognise the impact of microorganisms in ecological balance.
- Enlist and explain the ever-increasing list of applications of microorganisms in biotechnology agriculture, food production, and bioremediation.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Microbiology Historical developments of microbiology scope of microbiology, Brief account of organization and classification of microorganisms. Differences between prokaryotic and eukaryotic cell. Overview of bacterial cell structure, (size, shape, arrangement membrane, cell wall, cytoplasmic inclusions, mesosomes, flagella and motility, slime, capsule, pili, chemotaxis, endospore) The brief account of fungi, structure, physiology and classification,brief account of virus (bacteriophages) structure, life cycle (lytic and lysogenic)	L1, L2	6
Module II: Evolutionary microbiology and microbial diversity Microbial evolution and systematics, prokaryotic diversity: bacteria and archea, eukaryotic microorganisms (structure of algae and fungi), microbial community analysis (overview), classical and molecular taxonomy. Virology: Viruses and virions, growth and quantification, viral replication, viroids and prions, Bacterial, plant and animal viruses	L1, L2	6

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module III: Reproduction and Growth Life cycles of representative microorganisms including bacteria, fungi and viruses, population growth and its measurement, effect of environmental condition on growth pH, temp. aeration etc, continuous culture, diauxic, synchronous growth cultures and anaerobic cultures	L1, L2, L3	5
Module IV: Nutrition and Metabolism Modern concepts of bacterial nutrition, nutritional categories. Transport of nutrients (diffusion, active transport, group translocation) Introduction to oxidative and substrate level phosphorylations, brief account of metabolism of carbohydrates, EMP, ED, TCA and glyoxylate cycle and nucleic acids as building block in biosynthesis of cell constituents' synthesis of peptidogylcan polymer of cell wall	L1, L2	6
Module V: Microbial Genetics A general account of prokaryotic and eukaryotic genome, recombination, brief account of transformation, conjugation, transduction. concept of operon, induction, repression, catabolite repression. Control of Microorganisms: Control of microbes by physical and chemical agents. Antibiotics, properties and mode of action; Drug resistance and its significance. Antibiotic sensitivity test. Industrial uses of bacteria yeast & molds	L1, L2, L3	8
Module VI: Microbial Ecology Methods in microbial ecology (culture dependent and culture independent techniques), microbial habitats and nutrient cycling (Carbon, sulphur and nitrogen cycles), plant-microbes, animal-microbes' interactions. Soil microorganisms associated with vascular plants, bioremediation and biodegradation	L1, L2, L4	7
Module VII: Applied Microbiology Biocatalysts, microbial metabolites, wine production, single cell proteins, microbial transformation of steroids, role of microbes in food industry, production of dairy products (fermented milks and cheese), Role of microbes in Agriculture (biofertilizers, biopesticides), Wastewater treatment	L1, L2, L3	**7**

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2401 MICROBIOLOGY**				

Catalog Description

This lab course complements the theory course Microbiology (DBLS 2401). This course will introduce the students to basic microbiology lab techniques including media preparation, sterile culture techniques and standard practices and procedures. The approaches are relevant in both basic (biomedical) research and industrial applications of microorganisms.

Course Objectives

This course aims to prepare the students to carry out standard microbiology lab experiments including culture-media preparation, sterilization and sterile lab techniques, isolation and culture of microorganisms from natural sources, microscopic characterization of microorganisms by standard staining procedures.

Course Outcomes (COs):

Upon successful completion of this course, the student will be able to:

- Prepare culture media following sterile handling techniques, and sterilisation procedures.
- Characterise bacterial and fungal strains using simple staining techniques, and by biochemical tests.
- Estimate the rate of growth of microorganisms by preparing the Growth Curve using turbidometry technique
- Isolate bacterial strains from natural sources (such as soil and water) and culture them
- Recognise and explain the implications of biofilms in industry, environmental and health contexts.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Standard lab practices, sterilisation techniques, sterile handling techniques.	L1, L2, L3	4
Module II: Prepratiion different types of culture media for bacterial culture	L1, L2, L3	4
Module III: Staining techniques: Simple staining, differential staining	L1, L2, L3	4
Module IV: Growth curve measurement of bacterial population by turbidometry.	L1, L2, L3, L4	4
Module V: Biochemical tests to identifies the microorganisms	L1, L2, L3	4
Module VI: Isolation and enrichment culture of microorganisms from natural sources (soil, water)	L1, L2, L3	4
Module VII: Biofilm formation of *Candida auris*: culture and characterisation	L1, L2, L3	4

Course Code: DBLS2403	CELL BIOLOGY AND GENETICS	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2404 CELL BIOLOGY AND GENETICS LAB**				

Catalog Description

This course offers a comprehensive study of cell biology and genetics, providing students with a thorough understanding of cellular structure, function, and genetic principles. The curriculum covers the molecular and biochemical foundations of cell biology, including cell division, signaling, and the regulation of the cell cycle. Additionally, students will explore fundamentals of molecular genetics, principles of Mendelian inheritance, pedigree analysis in humans, and cancer genetics. The course emphasizes the integration of cell biology and genetics to understand cellular processes and genetic mechanisms

Course Objectives

This course aims to provide a foundational understanding of Cell Biology and Genetics. Students will explore the intricacies of cellular structures, delve into the principles of genetic inheritance, and unravel the molecular mechanisms governing life. By the end of the course, students will possess a comprehensive grasp of fundamental biological processes, from cell division to genetic expression, and be equipped with the knowledge to critically analyze and apply these concepts in diverse biological contexts. Students will also draw and analyse human pedigree charts. In addition, they will learn the basic of principles of cancer genetics, and familiarize with the different model organisms used in this field.

Course Outcomes (COs):

On successful completion of this course, students should be able to:

- Comprehend cellular structures and functions; describe the differences between prokaryotes and eukaryotes.
- Explain the function of the 4 classes of macromolecules (proteins, lipids, carbohydrates and nucleic acids) in the cell, with special emphasis on the structure and diverse functions of nucleic acids
- Explain the stages of cell division in mitosis and meiosis, and their significance. Comprehend the role of Cell cycle regulation mechanisms in regulating cell division.
- Understand the concepts of Mendelian genetics; comprehend the Mendelian principles in light of molecular genetics.
- Apply principles of inheritance in human genetics, draw pedigree charts, analyse the mode of inheritance, and make simple calculations to calculate the probability of inheritance of traits.
- Explain the different kinds of mutations that could predispose to or cause cancer.
- Explain the relevance of different model organisms used in genetics and cell biology research.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Cell is the fundamental unit of life Prokaryotic and eukaryotic cell structure; Overview of Cellular organelles and their functions; Plant cells vs. Animal cells; Haploid vs. Diploid cells, History of significant milestone discoveries in Cell Biology.	L1, L2, L3	5
Module II: Macromolecules as building blocks of cells DNA is the genetic material, RNAs have diverse roles, Proteins are the work-horses of the cell, Lipid membranes maintain the integrity of cell and organellar structures, Carbohydrates have structural and energy storage functions.	L1, L2, L3	5
Module III: DNA as the genetic material	L1, L2	5

Course Code: DBLS2404	CELL BIOLOGY AND GENETICS LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2403 CELL BIOLOGY AND GENETICS**				

Catalog Description

This lab course complements the lectures, allowing students to gain hands-on experience with modern techniques in cell biology and genetics. This course is fundamental for students pursuing careers in biological sciences and biotechnology.

Course Objectives

This course aims to give the students hands on experience on various aspects of practical research in the fields of cell biology and genetics.

Course Outcomes (COs):

Upon successful completion of this course, the student will be able to:

- Apply standardised experimental procedures to isolate cell organelles
- Observe and distinguish between different stages of cell division (both mitosis and meiosis)
- Draw pedigree chart based on available data, infer the mode of inheritance, and make probability based predictions on the inheritance
- Analyse published (FACS) results (on cell cycle arrest) and infer scientifically valid conclusions
- Extract useful pertinent information from OMIM
- Debate on the ethical considerations surrounding personal genome sequencing

Course Content:

Modules	Blooms level*	Number of hours
Module I: Chloroplast extraction from spinach leaf	**L1, L2, L3**	2
Module II: Mitosis & meiosis (observe prepared slides)	**L1, L2, L3**	2
Module III: Mitosis – onion root tip	**L1, L2, L3**	2
Module IV: Non-disjunction as cause of aneuploidy (case study based activity)	**L1, L2, L3, L4**	2
Module V: Pedigree analysis	**L1, L2, L3, L4**	4
Module VI: Analysis of FACS results in case of mutants in cell cycle regulation. (analysis of experimental data from publications).	**L1, L2, L3, L4**	2
Module VII: Case Study on cancer	**L1, L2, L3, L4**	4
Module VIII: OMIM (Online Mendelian Inheritance in Man) based inquiry into protein structure and genetic disease	**L1, L2, L3**	4
Module IX: Case study on ethical considerations in personal genome sequencing	**L1, L2, L3, L4**	4
Module X: Worm as a model organism	**L1, L2, L3, L4**	2

SEMESTER-V

Course Code: DBLS2501	BIOANALYTICAL & BIOPHYSICAL INSTRUMENTATION	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2502 BIOANALYTICAL & BIOPHYSICAL INSTRUMENTATION LAB**				

Catalog Description

The course will acquaint the students with the various instruments, their configuration and principle of working, operating procedures, data generation and its analysis. This course also provides the fundamental principles of different bio-analytical techniques, able to apply the math, science, and engineering knowledge gained in the course to the analysis of biomolecules.

Course Objective:

This course begins with a review of basic bio analytical technique and an introduction to general terminologies. This course contains bio analytical techniques along with their theory, working principal, common instrumentation and possible applications. The student will be exposed to principles, instrumentation & application of various instruments & techniques used in biological field.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Explain the principles of centrifugation for the separation and analysis of biomolecules and cellular components.
- Develop the ability to determine the appropriate electrophoretic methods for the separation and characterization of proteins, nucleic acids, and other biomolecules.
- Explain the principle of chromatographic techniques for the efficient separation, identification, and quantification of complex biological mixtures.
- Acquire basic theoretical knowledge about spectroscopic and diffraction techniques to determine the structural and functional properties of biomolecules.
- Able to explain the principles of optics relevant to different types of microscopy, and the appropriate choice of microscopic technique for different kinds of samples and analysis.
- Elucidate the utility of radioisotope techniques for tracing, quantifying, and analyzing biological processes at the molecular level.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Hydrodynamic Techniques: Centrifugation • Viscosity and diffusion, Sedimentation equilibrium, • Analytical and Preparative centrifuges, • Application of density gradient and differential centrifugation.	**L1, L3**	7
Module II: Electrophoretic Techniques • Paper and gel electrophoresis, • Immuno electrophoresis, • Isoelectric focussing, two - dimensional electrophoresis, • Capillary electrophoresis	**L1, L2, L3**	8
Module III: Chromatographic Methods • Paper, TLC • gas chromatography,	**L3, L4, L6**	7

• gel filtration, ion-exchange chromatography, • affinity chromatography and • HPLC, FPLC, adsorption and desorption.		
Module IV: Spectroscopic and Diffraction Techniques • UV and visible, spectrofluorimetry, • Atomic absorption spectrophotometry, • Mass Spectrometry, Infrared and Raman Spectroscopy, • Mossbauer, MALDITOF, ORD and Circular Dichorism, • Nuclear Magnetic Resonance and Electron Spin Resonance spectroscopy, • X - Ray diffraction, Electron diffraction, Neutron Diffraction.	**L1, L2, L4**	8
Module V: Optical Techniques: Microscopy • Optical and Electron Microscopy, • Transmission and Scanning Electron Microscopy, • Tunneling Electron Microscopy, • Atomic Force Microscopy, • Polarization and Fluorescence microscopy.	**L1, L3, L4, L6**	8
Module VI: Radioisotope Techniques • Radio tracers, • GM Counter, • Proportional and Scintillation Counters, • Autoradiography, radio - immunoassay.	**L1, L3, L4**	7

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2502	BIOANALYTICAL & BIOPHYSICAL INSTRUMENTATION LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2501 BIOANALYTICAL & BIOPHYSICAL INSTRUMENTATION**				

Catalog Description

Bioanalytical & Biophysical Instrumentation Labs are vital for advancing research, enhancing diagnostic and therapeutic methods, ensuring quality and safety, and promoting education and innovation in biomedical and biotechnological fields. Emphasis will be placed on understanding the theoretical foundations of each technique, as well as developing practical skills in data acquisition and analysis. The course will also cover the latest advancements in the field and explore their implications for biomedical research and biotechnology.

Course Objectives

The objectives of this course are to provide the Students with the understanding of various analytical techniques used in biotechnology based research and industry. An ability to demonstrate the basic science as well biotechnology knowledge of biotech industry and develop the skills to understand the theory and practice of bioanalytical techniques.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Master various cell disruption techniques to efficiently break open cells and extract their contents for analysis, with a sound understanding of the underlying scientific principles.
- Understand and apply both low-speed and high-speed centrifugation methods to separate cellular components and biomolecules.
- Develop proficiency in using spectrophotometer techniques to measure the concentration and absorption properties of biomolecules.
- Gain practical skills in performing paper chromatography and thin layer chromatography to separate and identify components in biological mixtures.
- Conduct agarose gel electrophoresis to separate, identify, and analyze nucleic acids.
- Explain the scientific principles underlying the functioning and use of polarization and fluorescence microscopy to visualize and study the structural and functional properties of biological specimens.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Cell disruption techniques.	L1, L3 L4, L6	2
Module II: Centrifugation – low speed and high speed.	L1, L2, L3 L4	4
Module III: Spectrophotometer techniques	L1, L3 L4, L5	6
Module IV: : Chromatography –Paper Chromatography and Thin Layer Chromatography	L1, L2 L3, L4	6
Module V: Electrophoresis –SDS Page and Agarose gel electrophoresis.	L1, L3 L4, L6	8
Module VI: Polarization and fluorescence microscopy	L1, L2 L3, L4,	4

Course Code: DBLS2503	INTRODUCTION TO IMMUNOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2504 INTRODUCTION TO IMMUNOLOGY LAB**				

Catalog Description

This course explores the role of the basics of physiological defense mechanisms, it teaches the learner to identify and investigate different immunological barriers and components of physiology that work at different level of exposure to infections. Introductory immunology course in the biotechnology landscape, leads students in building knowledge to understand the biology of disease and defense mechanism to counter different physiological adversities. The course is theoretically driven and delivers the concepts related to immune components, mechanism of immune action, disease detection and immunological therapies all under one umbrella. Students then use that knowledge to analyze and present their study in detection, sensing, and designing cures for disease management and medical biotechnology in the future.

Course Objectives

The course aims to provide students with a foundational knowledge of immunology, its importance in human health, and its relevance in various aspects of biology and medicine. Role of antibody engineering in biomedical applications and the importance of immune detection in disease processes, tissue transplantation and immune therapies. regulations are some of the areas of attributes of this course which can help the students to understand the biotechnology related to humankind.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Recall the history of immunology. Explain the cells and organs of immune system evolutionarily contributing in developing defence mechanism.
- Describe the structure, classification and physico-chemical features of antigen and antibody.
- Explain the key mechanistic pathways to establish antigen-antibody reactions, antigen processing and presentation and regulation of immune response.
- Explain the processes involving immune disorders. Illustrate the mechanism of action in developing autoimmune, hypersensitive and immune compromised physiological situations.
- Recognise varied immune responses like active, passive, cell mediated and humoral immune actions. Recognise the mechanism and significance of complement activation, amplification and attack mechanism.
- Enlist and explain ever increasing advancement in the field of immunotherapy. Elaborate the technology of Monoclonal antibody production, organ and tissue Transplantation, Cancer immunology, Vaccine biology and graft vs host rejection.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Historical perspective of immune system and immunity, innate and specific immunity, humoral immunity, cell-mediated immunity	L1, L2	7
Module II: Antibody structure in relation to function and antigen-binding, types of antibodies and their structures: isotypes, allotypes, idiotypes, genetic basis of antibody diversity, synthesis of antibody and secretion	L1, L2	7
Module III: The organs and cells of the immune system, histocompatibility: structure of MHC class I, II & III antigens & their mode of antigen presentation, MHC restriction, antigens & antigenicity	L1, L2, L3	7

Course Code: DBLS2504	INTRODUCTION TO IMMUNOLOGY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2503 INTRODUCTION TO IMMUNOLOGY**				

Catalog Description

This course explores the role of theoretical knowledge from the Introductory immunology course to corelate with lab-based observation, ideation and application. This course teaches the learner to observe and investigate different immune-components and immune assays in hand. The course is driven wet lab-based, as it delivers the concepts related to the morphology of different cells and components of immune system and explores immune assays to detect abnormal physiological situations. Students then use that knowledge to detect basic differences between blood parameter oriented normal and diseased situations and develop technologies that improvise the therapeutic aspect analytically.

Course Objectives

The course aims to provide students with hands-on experience in laboratory techniques and procedures commonly used in immunology research. It will help students gain a deeper understanding of fundamental immunological concepts and principles and design experiments, plan protocols, and troubleshoot issues that may arise during laboratory work.

Course Outcomes (COs):

After the completion of this course students will be able to:

- Determine the various ways to make buffers and stain compositions of biological interest and their significance.
- Isolate blood cells, prepare blood film, identify the RBCs and WBCs morphology.
- Detect and confirm antigen-antibody reaction for microbial infection.
- Draw standard calibration curve of known concentration Vs Absorbance and from that they can determine the product released from the graph.
- Explain the relationship between different antigen concentration and epitope pattern in relation to antibody reaction on semisolid matrices.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Blood film preparation and identification of blood cells.	L1, L2, L3	2
Module II: Determination of the blood group and Rh factor of an individual.	L1, L2, L3	2
Module III: Separation of lymphocytes from human blood using density gradient media	L1, L2, L3	3
Module IV: WIDAL Test	L1, L2, L3	3
Module V: Radial immuno diffusion test, Ouchterlony double diffusion test	L1, L2, L3 L4, L5	3

Course Code: DBLS2505	BIOSTATISTICS AND BIOINFORMATICS	L	T	P	C
Version	2023	4	0	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This undergrad course introduces students to the interdisciplinary fields of bioinformatics and biostatistics. Students will learn how to apply computational tools and statistical methods to analyze biological data. The course covers the basics of bioinformatics, including sequence analysis, data mining, and genomics, as well as fundamental concepts in biostatistics such as probability, hypothesis testing, and data interpretation.

Course Objectives

This course is aimed to equip the students with the essential tools to analyze and interpret biological data. From mastering statistical methods for experimental design to harnessing the power of bioinformatics tools for genomic analysis, this course empowers the student to navigate the complex landscape of biological information. Students will be able to gain the skills to extract meaningful insights, make informed decisions, and contribute to advancements in the life sciences through the lens of statistical analysis and bioinformatics.

Course Outcomes (COs):

CO1: Understand the basic concepts and applications of bioinformatics and biostatistics.
CO2: Use computational tools to analyze biological data.
CO3: Apply statistical methods to interpret biological research findings.
CO4: Conduct basic bioinformatics and biostatistical analyses

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Data Introduction Samples vs. Populations Collecting Data and Sampling Techniques Experimental Design: Randomization: Ensures unbiased allocation in experiments. Control Groups: Critical for drawing valid conclusions from experiments	**L1, L2**	6
Module II: Organizing Data Tabular Displays Graphical Displays	**L1, L2, L3**	4
Module III: Descriptive Statistics Measures of Centre (central tendency) Measures of Spread Measures of Placement	**L3, L3,**	4
Module IV: Probability Introduction Three Types of Probability Complement Rule Union and Intersection Independent Events	**L1, L2,L3**	6

Venn diagrams to solve problems in Probability Conditional Probability		
Module V: Basics of Probability Distributions Introduction to Discrete Probability Distributions: Binomial Distribution Introduction to Continuous Probability Distributions: Normal Distribution	**L1, L2**	4
Module VI: Hypothesis Tests Type I and I l Errors Hypothesis Test for One Mean Hypothesis Test for One Proportion Two Sample Mean T-Test for Dependent Groups Chi-Square Tests: Goodness of Fit Test; Test for Independence	**L2, L3**	6
Module VII: Correlation and Regression Correlation Scatterplots Simple Linear Regression	**L2, L3**	4
Module VIII: Introduction and overview Bioinformatics- definition, application of bioinformatics in different areas of life sciences, Basics of biological databases and biological software's	**L1, L2**	4
Module IX: Biological Databases Biological Databases- types of biological databases, Nucleotide database – NCBI, EMBL, DDBJ, Protein Databases- PDB, UniProt, Specialised databases- KEGG, organism specific databases, Sequence file formats	**L2, L3**	6
Module X: Sequence analysis Sequence alignment- Global and local alignments, Pairwise and Multiple sequence alignment, Dot plot, scoring matrices and gap penalties, programs used for sequence alignment	**L2, L3**	6
Module XI: Phylogenetic analysis Phylogenetic analysis- definitions, basic terminologies, Phylogenetic tree- cladogram, dendrogram, ultra metric trees and additive trees etc, rooted and unrooted trees, tree building methods- character and distance-based methods	**L1, L2, L3**	5
Module XII: Structure Prediction Structure file formats, Secondary and tertiary structure prediction methods in proteins, software to visualize secondary and tertiary structural information in protein.	**L2, L3**	5

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2506	BIOETHICS, BIOSAFETY AND IPR	L	T	P	C
Version	2023	4	0	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

The focus of the course is to recognize, learn and understand the role intellectual property rights (IPR) and its implications in biotechnology sector. The students are intended to learn about the concept of biosafety and bioethics role in domain. This course will make the student gain the knowledge about the ethical implication of biological process and products with recombinant DNA guidelines. The students will practice the GLP and follow guidelines for research involving Transgenic, cloning and new BT technologies.

Course Objectives

This course aims to equip students with a comprehensive understanding of bioethical principles, biosafety practices, and intellectual property rights (IPR) in biotechnology. Students will explore ethical issues in biotechnology and biomedical research, learn to implement biosafety measures, understand IPR and regulatory frameworks (laid down by WIPO), and develop critical thinking skills through case studies. This course prepares students to navigate ethical, safety, and legal challenges in scientific research and innovation.

Course Outcomes (COs):

- Enunciate the fundamental principles of bioethics, including ethical theories and frameworks, and apply them to various biological and biomedical scenarios.
- Acquire knowledge of biosafety levels, guidelines, and practices, and learn to implement appropriate safety measures in biological research and laboratory settings.
- Analyze and discuss ethical issues related to biotechnology and biomedical research, such as genetic engineering, cloning, stem cell research, and human experimentation.
- Discuss the basics of intellectual property rights (IPR) in the context of biotechnology, including patents, trademarks, copyrights, and trade secrets.
- Recognize the national and international regulatory frameworks (WIPO) governing biosafety, bioethics, and IPR, and understand the importance of compliance in research and commercialization.
- Develop critical thinking and decision-making skills by analyzing real-world case studies related to bioethics, biosafety, and IPR, and learn to navigate complex ethical dilemmas in the field of biotechnology.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Bioethics • Overview of bioethics principles; • Historical perspectives on ethical issues in biotechnology; • Emerging ethical issues in genetic research, gene editing, cloning, and stem cell research, Human and animal experimentation, animal rights/welfare, • Informed consent and human subjects research; • Agricultural biotechnology: genetically engineered food, environmental risks, labelling, and public opinion	**L1, L2, L3**	7

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module II: Biosafety and Laboratory Practices • Concept of biosafety: Role of WHO • Risk groups (RG 1, 2, 3, 4) Biosafety levels (BSL-1, BSL-2, BSL-3, BSL-4) and biological safety cabinets classes, lab design and rules • Primary and Secondary containment for biohazards; GRAS organisms; Biohazard sign, Lab safety, Role of Biosafety Officer. • Recommended biosafety levels for infectious agents and infected animals • Definition of GMOs & LMOs; Indian recombinant DNA guidelines. • Environmental risk assessment and food/feed safety assessment of transgenic crops; Principles of safety assessment of transgenic plants: risk assessment steps, concepts of familiarity and substantial equivalence	**L1, L2, L3, L4**	7
Module III Regulatory Frameworks and Policy: • Overview of regulatory bodies in biotechnology at international, national, regional, and institutional levels. • Biosecurity considerations and international agreements (Cartagena protocol, OECD consensus documents, Codex Alimentarius) • Indian regulations (EPA act and rules, RCGM, GEAC, IBSC, Biotechnology Regulatory Authority of India draft bill) • GM labelling and Food Safety and Standards Authority of India (FSSAI) • OECD- GLP and its international status and MAD agreement. • Biosafety Management: The key to the environmental responsible use of biotechnology	**L2, L3, L4, L5**	7
Module IV: Intellectual Property Rights (IPR) and WIPO • Introduction to intellectual property (IP): patents, trademarks, copyrights, industrial design, traditional knowledge, geographical indications, design, plant breeders right (PBR) and layout of IC design, Trade secrets. • Historical context of GATT, WTO, WIPO, and TRIPS • Protection of new GMOs; IP's role in R&D • Plant variety protection and farmers' rights act • Patent databases and country-wise patent searches (USPTO, EPO, India) • Case studies	**L1, L3, L4, L5**	7
Module V: Patenting: • Basics of patents: types of patents; Indian Basics of patents: types, Indian Patent Act 1970, recent amendments • WIPO Treaties, Budapest Treaty, Patent Cooperation Treaty (PCT) • Patent application procedures and filing system • Precautions before patenting, patent application forms and guidelines, fee structures, time frames • Types of patent applications: provisional and complete specifications, PCT and conventional patent applications • International patenting requirements and procedures; financial assistance for patenting, Publication of patents and patent infringement.	**L1, L3, L4, L5, L6**	7
Module VI: Commercialisation of IP: • Licensing and royalty management • Patenting by research students and scientists: university/organizational rules • Collaborative research: IP management, benefit/credit sharing, commercial and non-commercial incentives; • Case studies on national and international BT products and processes.	**L4, L5, L6**	7

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

SEMESTER-VI

Course Code: DBLS2601	APPLIED BIOLOGY	L	T	P	C
Version	2023	4	0	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

Applied biology is an interdisciplinary science that applies principles associated with biology and engineering. This subject provides the knowledge of basic principle of fermentation process, which help students to design, develop and operate industrial level. This fundamental knowledge is essential for students to make their career in industry based on bioprocess. This course also provide the study of industrially relevant microbial strains and processes for production of enzyme, biopolymer and food products.

Course Objectives

To make the students to explore of India`s rich microbial diversity for novel bioactive molecules and biocatalysts with application in agriculture and industry. Our aim is R&D leading to the production of industrially important enzymes, antibiotics, biocatalysts, biotransformation of steroids and agriculture crop yield improvement through microbial fertilizers. Main activities include production, process optimization, scale up, downstream processing, purification & characterization of immobilized enzymes for industrial applications.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the basic principles and that applies principles associated with microbiology.
- Understand the commercial exploitation of microorganisms on a large scale.
- Discuss the basic principle of fermentation process, which help students to design, develop and operate industrial level production of metabolites.
- Discuss the production of microbial enzymes, biofertilizers, biopesticides and modern biotechnological products
- Prepare the students to make their career in industry based on fermentation process.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to fermentation, the fermentation industry, Production process batch and Continuous system of cultivation, Solid-state fermentation	L1, L2, L3	5
Module II: Selection of industrial microorganisms, media for fermentation, aeration, pH, temperature and other requirements during fermentation, downstream processing and product recovery, food industry waste as fermentation substrate.	L1, L2, L3	6
Module III: Production of compounds like antibiotics, enzymes, organic acids, solvents, beverages, SCP.	L1, L2, L3	7
Module IV: Production of fermented dairy products like yakult, kaffir, cheese, buttermilk etc.	L1, L2, L3	6
Module V: Immobilized enzymes systems, production and applications.	L1, L2, L3	6
Module VI: Applied Biology Applications	L1, L2, L3	6

Course Code: DBLS2602	GENOMICS AND PROTEOMICS	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBLS2601 GENOMICS AND PROTEOMICS LAB**				

Catalog Description

This comprehensive course offers an in-depth exploration of genomics and proteomics. It begins with an introduction to DNA structure and function, cells, chromosomes, and genetic inheritance. It covers the human genome, gene roles in health and disease, genetic mutations, DNA microarrays, and the Human Genome Project. The societal impact and ethical considerations of genomics, genetic testing, and personalized medicine are discussed. The course also delves into the world of proteins, their functions, and the techniques used to study them, such as 2D gel electrophoresis and mass spectrometry. Additionally, it explores proteomics' role in disease diagnosis, drug development, and personalized medicine.

Course Objectives

The course helps in developing a detailed understanding of eukaryotic genome complexity and organization. Current research on the molecular basis of the control of gene expression in eukaryotic system has developed a detailed understanding of techniques of gene diagnostics and DNA profile to acquire the fundamentals of genomics and Proteomics.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the basics of DNA structure and genetic inheritance.
- Analyze the human genome and its role in health and disease.
- Explore ethical considerations and societal impacts of genomics.
- Learn knowledge of protein functions and metabolic processes.
- Understand techniques such as PCR, DNA microarrays, and mass spectrometry.
- Apply proteomics in disease diagnosis and personalized medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Genomics: Understand the basics of genomics and the structure of DNA. What is DNA? – Structure and Function, Cells and Chromosomes – Building Blocks of Life, Introduction to Genetic Inheritance – How Traits Are Passed On, Real-Time PCR and Its Application in Genomics.	**L1, L2, L3**	7
Module II: Exploring the Human Genome: Origin of genomes, Human genome and the role genes play in health and disease. Mapping the Human Genome – An Overview, Genes and Their Role in Disease, Genetic Mutations and Variation, DNA Microarrays: An Introduction to Genomic Expression Analysis, Introduction to molecular markers-RFLP, RAPD, AFLP, SSRs, DNA fingerprinting, Human Genome Project.	**L1, L2, L3**	8
Module III: Genomics in Society: Discuss the impact of genomics on society and the ethical considerations. Genetic Testing and Personalized Medicine, Ethics of Genetic Modification and CRISPR, siRNA and miRNA: Small RNAs with Big Roles in Gene Regulation,	**L1, L2**	8

Chromatin Immunoprecipitation (ChIP): Connecting DNA and Protein Interactions.		
Module IV: Introduction to Proteomics: Introduce the world of proteins and their functions in the body. Proteins and Their Functions, From DNA to Protein – Transcription and Translation, Enzymes and Metabolism, Protein Separation Techniques: Diving into 2D Gel Electrophoresis	**L1, L2**	8
Module V: Techniques in Proteomics: Explore how scientists study proteins and their structures. Protein Structure and Function, Introduction to Mass Spectrometry and Protein Sequencing, Protein Interactions and Pathways, Mass Spectrometry in Proteomics: The Mass Spec Revolution, Post-Translational Modifications: Beyond the Genetic Code.	**L1, L2, L3**	8
Module VI: Proteomics in Health and Disease: Understand the role of proteomics in diagnosing and treating diseases. Biomarkers and Disease Diagnosis, Drug Design and Development, Personalized Medicine and Proteomics, Protein-Protein Interactions: Networking in the Cell, Protein Microarrays and Their Applications in Proteome Analysis.	**L1, L2**	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2603	GENOMICS AND PROTEOMICS LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2602 GENOMICS AND PROTEOMICS**				

Catalog Description

This course equips students with practical skills in computational genomics and structural proteomics. It covers the use of bioinformatics tools for DNA sequence analysis, genetic variation identification, and mutation impact prediction. Students will learn to navigate genomic sequences using BLAST, search SNP databases, and utilize genome browsers. The course also delves into protein structure analysis through the Protein Data Bank, visualization with UCSF Chimera, and examination of protein domains and active sites. By understanding the structural effects of mutations, students will gain insights into the functional implications for proteins, enhancing their ability to apply these techniques in research and clinical settings.

Course Objectives

The course helps in developing a detailed understanding of practical skills in laboratory techniques commonly used in genomics and proteomics research.

Course Outcomes (COs):

On completion of this course, students should be able to:

1. Master bioinformatics tools for DNA sequence analysis and genetic variation identification.
2. Predict the impact of genetic mutations on protein function using computational tools.
3. Analyze and visualize protein structures, understanding their functional implications.
4. Explore the structural effects of mutations on proteins and their consequences for disease and therapy.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Computational Genomics Fundamentals **Objective:** Gain hands-on experience with bioinformatics tools to analyze DNA sequences and identify genetic variations. • **BLAST:** Navigating Genomic Sequences - Learn to use BLAST for sequence alignment and identifying gene families, • **Genetic Variation and Disease -** Use databases to search for SNPs and understand their clinical significance, • **Mutation Impact Prediction -** Apply tools like SIFT or PolyPhen to analyze the effects of mutations on protein function, • **Genome Browsers: Windows into Genomic Data** - Get acquainted with tools such as UCSC Genome Browser for in-depth genomic data analysis.	**L1, L2, L3, L4**	15
Module II: Structural Proteomics Analysis **Objective:** Explore protein structure and function through computational analysis and visualization techniques. • **Protein Data Bank (PDB):** The Repository of Protein Structures - Learn to retrieve and analyze protein structures from PDB, • **UCSF Chimera: Visualizing Protein Complexes** - Use UCSF Chimera for protein visualization to study structure-function relationships,	**L1, L2, L3, L4**	15

Course Code: DBLS2604	EMERGING FIELDS - NANOBIOTECHNOLOGY AND STEM CELLS BIOLOGY	L	T	P	C
Version	2023	3	1	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course provides the learners to gain basic knowledge about the two emerging areas of science, one is stem cell biology and the second is nanobiotechnology. The course explores the topics starting from the introduction to application and allows the students to gain insights about these two emergent scientific areas. It also prepares them for advanced studies which further help the learners to explore and contribute to the field through research and development. The course also teaches the learners about good practices and ethics.

Course Objectives

The course is structured to offer a insight into two cutting-edge areas of scientific exploration: Nanobiotechnology and Stem-cell Biology. On the nanobiotechnology front, students will be exposed to the fundamentals of nanoscale materials, their design, fabrication, and potential applications in various fields including medicine, energy, and environment. Parallelly, the segment on stem-cell biology will provide a broad overview of mammalian stem cells, elucidating on their sources, types, cultivation techniques, and their transformative potential in disease therapeutics and regenerative medicine. This course aims to arm students with foundational knowledge in both domains, empowering them to stay at the forefront of these rapidly evolving scientific landscapes.

Course Outcomes (COs):

Upon successful completion of the course the students will be able to:

- Discuss the fundamental principles of stem cell biology, including the types, sources, and differentiation pathways of stem cells.
- Evaluate the current and potential clinical applications of stem cells in regenerative medicine and therapy, along with the associated medical and logistical considerations.
- Comprehend the basic concepts and techniques of nanobiotechnology and how nanomaterials interact with biological systems.
- Assess the applications of nanobiotechnology in various fields and analyze the potential toxicity and safety concerns related to nanomaterials.
- Analyze the ethical issues and societal impacts related to the use of stem cells and nanobiotechnology, fostering informed and responsible scientific practices.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Foundations of Stem Cell Biology The module covers the introduction to stem cell biology and its therapeutic potential, types of stem cells including embryonic stem cells and their characteristics and culturing techniques, adult stem cells with their sources and differentiation pathways, advanced techniques in stem cell culture, and the benefits and challenges associated with stem cell technology.	L1, L2, L3	8
Module II: Clinical Applications and Considerations Topics in this module include the promises of stem cell-based therapies, targeted therapeutic applications such as the use of stem cells in diabetes treatment and cardiac repair, the regulatory framework highlighting the ethical and legal aspects	L1, L2, L3	12

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

of stem cell, safety protocols for evaluating human stem cell applications, and the exploration of genetically modified stem cells in experimental gene therapies.		
Module III: Introduction to Nanobiotechnology Nano regime and nanobiotechnology, properties of nanomaterials, different types of nanomaterials – nanomaterials of different shapes and sizes, graphene, quantum dots, nanocomposite, physicochemical characterization of nanomaterials – UV-Visible spectroscopy, X-Ray Diffraction, X-Ray Photoelectron Spectroscopy, electron microscopy.	L3, L4, L5	12
Module IV: Application of Nanobiotechnology and toxicity Nanomaterials in medical imaging, targeted drug delivery, nanomedicine, nano sensors, nano-theranostics, nanodevices, nanotoxicity.	L3, L4, L5	8
Module V: Ethical Considerations in Stem Cells and Nanobiotechnology This module will delve into the ethical landscape surrounding both stem cell research and nanobiotechnology. Topics will include the ethical debates surrounding embryonic stem cell research, the use and potential misuse of nanotechnologies, considerations regarding patient rights and informed consent, and the broader societal implications of these rapidly advancing fields. Additionally, the module will touch upon the global perspectives on these ethical concerns, providing students with a well-rounded understanding of the challenges and responsibilities faced by researchers and professionals in these areas, risks of using nanomaterials and various rules governing the health and safety standards related to nanomaterials.	L3, L4, L5, L6	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2605	INTRODUCTION TO NEUROSCIENCE AND INFORMATION FLOW	L	T	P	C
Version	2023	3	1	0	4
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course provides an overview of the neuroscience topics starting from structure and function to disease development that help the learners to acquire a basic knowledge of neuroscience. This course also explores fundamental knowledge behind Behavioral neuroscience, ethics and emerging topics.

Course Objectives

The objective of this course is to introduce undergraduate students to the basic knowledge in Neuroscience in topics ranging from structure of neuron, information transmission through nervous system, function of sensory systems, basics of Behavioral neuroscience, and diseases of the nervous system. This course will also introduce students to the ethics of research in neuroscience and provide a glimpse of recent research in this field

Course Outcomes (COs):

- Describe the basic principles and structure of the nervous system, including neural cell types, neuroanatomy, and neural development.
- Comprehend the mechanisms of neural signalling, including action potentials, synaptic transmission, and neurotransmitter function.
- Analyse the organization and function of sensory and motor systems, including the pathways and processes involved in sensory perception and motor control.
- Explain the relationship between brain function and behaviour, examining how neural circuits influence cognitive processes, emotions, and actions, using specific examples.
- Identify and describe specific examples of neurological and psychiatric disorders, understanding their underlying neural mechanisms and potential treatments.
- Discuss the current advancements and future directions in neuroscience research, and the ethical considerations in this field of research.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Foundations of Neuroscience: • Introduction to neuroscience • Historical perspectives • Overview of the nervous system • Neuron structure and function	L1, L2, L3	6
Module II: Neural Communication: • Action potentials and membrane potential • Synaptic transmission • Neurotransmitters and receptors • Neural circuits and signalling pathways	L1, L2, L3	8
Module III: Sensory Systems and Motor Systems: • Introduction to Vision, Auditory, Olfactory, Gustatory and Somatosensory System • Motor neurons and muscle contraction • Motor coordination, learning and plasticity	L3, L4, L5	10

SEMESTER-VII

Course Code: DBLS2701	ADVANCED BIOCHEMISTRY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This graduate-level course offers an in-depth exploration of advanced topics in biochemistry, focusing on the molecular mechanisms that govern cellular processes. It covers the structure and function of biomolecules, metabolic pathways, enzyme kinetics, molecular signaling, and the latest research techniques in biochemistry.

Course Objectives

The primary focus of this course is advanced understanding of protein structure and enzymology. It is also aimed to expose the students to the technological applications in understanding the process of photosynthesis, and production of secondary metabolites through metabolic engineering.

Course Outcomes (COs):

By the end of this course, students will be able to:

- Explain the structure, function, and dynamics of proteins, including protein folding, interactions, and techniques for protein analysis.
- Analyse the principles of enzyme kinetics, mechanisms of enzyme action, roles of co-enzymes & co-factors, and methods for studying enzyme activity and regulation.
- Comprehend the coordination and regulation of cellular metabolic pathways by hormones and their impact on overall metabolic homeostasis.
- Explore the regulatory mechanisms involved in photosynthesis, including the light-dependent and light-independent reactions and their integration within the plant cell.
- Investigate the biosynthesis, functions, and ecological roles of secondary metabolites in plants, as well as their applications in biotechnology and medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Proteins Types of proteins and their classification, Forces stabilizing protein structure and shape. Different Level of structural organization of proteins, Protein Purification. Denaturation and renaturation of proteins. Fibrous and globular protein.	L1, L2, L3	8
Module II: Enzymes Enzyme, prosthetic groups, metalloenzymes, monomeric & oligomeric enzymes, activation energy and transition state, enzyme activity, specific activity, common features of active sites, enzyme specificity: types & theories, Biocatalysts from extreme thermophilic and hyper-thermophilic archaea and bacteria. Role of: NAD+, NADP+, FMN/FAD, coenzymes A, Thiamine pyrophosphate, Pyridoxal phosphate,lipoic-acid, Biotin vitamin B12, Tetrahydrofolate and metallic ions	L1, L2, L3	10
Module III: Integration of cellular metabolism and hormonal regulation Action of major hormones (insulin, glucagons, epinephrine) responses to metabolic stress; starvation, metabolic disorders (phenylketonuria, arthritis) and role of antifolates in chemotherapy.	L1, L2, L3, L4	9
Module IV: Regulatory aspects of photosynthesis	L1, L2, L3	9

Course Code: DBLS2702	ADVANCED BIOCHEMISTRY AND ANALYTICAL TECHNIQUES LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

The course incorporates practical laboratory experience into students, preparing students for research and professional careers in biochemistry and related fields. This course aims to equip students with advanced knowledge and skills in biochemistry, fostering their ability to conduct independent research and contribute to the scientific community.

Course Objectives

The course aims to provide an advanced understanding of the core principles and topics of Biochemistry and their experimental basis.

Course Outcomes (COs):

- Develop the ability to use colorimetric techniques to quantify biomolecules by measuring their absorbance properties.
- Gain proficiency in various chromatographic methods to separate, identify, and analyze complex biological mixtures.
- Master the techniques of PAGE and SDS-PAGE for the separation, visualization, and analysis of protein samples.
- Acquire skills in extracting total lipids and separating them using thin layer chromatography, including calculating Rf values for lipid identification.
- Learn to characterize isolated nucleic acids by performing and interpreting agarose gel electrophoresis results.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Colorimetry Colorimetry and Spectrometry: Beer Lambert's law, Transmittance, Absorbance, Optical density; Types of Spectroscopies: UV & Visible - Principle, instrumentation & application.	L2, L3	6
Module II: Chromatographic Techniques Partition- Adsorption-Ion Exchange- Molecular sieve and Affinity chromatography; Principles of Gas Liquid chromatography and High-Performance Liquid Chromatography.	L3, L4	6
Module III: Proteins Electrophoretic (PAGE and SDS-PAGE) separation of isolated proteins.	L3, L4	6
Module IV: Lipids Extraction of total lipids by Folch's method; thin layer chromatographic separation of lipids, R_f value	L2, L3	6
Module V: Nucleic Acid Characterization of isolated nucleic acid by agarose gel electrophoresis.	L3, L4	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2703	ADVANCED MICROBIOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	**DBLS2704 ADVANCED MICROBIOLOGY LAB**				

Catalog Description

This course will build upon ideas introduced in general microbiology classes by using microbiological techniques to study and identify unknown organisms. In addition to studying microbial diversity, students will learn the similarities and differences between microorganisms in their genetic, biochemical and metabolic profile. The different mechanisms of checking the growth and spread of microorganisms, and the interaction of microorganisms with their hosts and environment will also be discussed.

Course Objectives

The objectives of this course are to introduce field of microbiology with special emphasis on microbial diversity, morphology, physiology and nutrition; methods for control of microbes and host- microbe interactions.

Course Outcomes (COs):

Students should be able to:

- Identify major categories of microorganisms and analyze their classification, diversity, and ubiquity;
- Identify and demonstrate structural, physiological, genetic similarities and differences of major categories of microorganisms;
- Identify and demonstrate how to control microbial growth;
- Demonstrate and evaluate interactions between microbes, hosts and environment

Course Content:

Modules	Blooms level*	Number of hours
Module 1 Microbial characteristics Introduction to microbiology and microbes, history & scope of microbiology, morphology, structure, growth and nutrition of bacteria, bacterial growth curve, bacterial culture methods; bacterial genetics: mutation and recombination in bacteria, plasmids, transformation, transduction and conjugation; antimicrobial resistance	L1, L2, L3	6
Module 2 Microbial diversity Microbial taxonomy and evolution of diversity, classification of microorganisms, criteria for classification; classification of bacteria; Cyanobacteria, acetic acid bacteria, Pseudomonads, lactic and propionic acid bacteria, endospore forming bacteria Mycobacteria and Mycoplasma. Archaea: Halophiles, Methanogens, *Hyperthermophilic archae*, Thermoplasm; eukarya: algae, fungi, slime molds and protozoa; extremophiles and unculturable microbes.	L1, L2, L3	6
Module 3 Control of microorganisms Sterilization, disinfection and antisepsis: physical and chemical methods for control of microorganisms, antibiotics, antiviral and antifungal drugs, biological control of microorganisms.	L1, L2, L3	6
Module 4 Virology	L1, L2, L3	6

Course Code: DBLS2704	ADVANCED MICROBIOLOGY LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2703 ADVANCED MICROBIOLOGY**				

Catalog Description

The Advanced Microbiology Lab course offers hands-on experience with sophisticated techniques in microbiological research. Students will engage in practical applications of microbial culturing, genetic manipulation, and biochemical analysis. Key areas include microbial physiology, biofilm formation, and pathogen identification. This course is designed to complement Advanced Microbiology (DBLS2703) lectures, imparting essential skills for research and industry applications.

Course Objectives

This course aims to impart hands-on experience in basic microbiology tools and techniques, training to work on research projects as a team, along with essential skills in designing & conducting experiments, data collection & analysis, and record keeping & scientific communication.

Course Outcomes (COs):

Upon completion of this course, students will:

- Gain hands-on experience in culturing, isolating, and identifying various microorganisms using advanced microbiological techniques.
- Conduct experiments to understand microbial growth, metabolic pathways, and physiological responses under different environmental conditions.
- Investigate the mechanisms of biofilm development and the pathogenicity of microorganisms through practical experimentation.
- Develop skills in data collection, statistical analysis, and interpretation of experimental results in microbiology.
- Work collaboratively in a team setting to conduct experiments, analyze results, and present findings clearly and professionally.
- Adhere to strict laboratory safety protocols and maintain accurate, detailed laboratory records.

Course Content:

Modules	Blooms level*	Number of hours
Module 1: Sterilization, disinfection and safety in microbiological laboratory.	**L1, L2, L3**	2
Module 2: Preparation of media for cultivation of bacteria.	**L1, L2, L3**	2
Module 3: Isolation of bacteria in pure culture by streak plate method.	**L1, L2, L3**	2
Module 4: Study of colony and growth characteristics of some common bacteria: Bacillus, E. coli, Staphylococcus, Streptococcus, etc.	**L1, L2, L3**	2
Module 5: Preparation of bacterial smear and Gram's staining.	**L1, L2, L3**	2

Course Code: DBLS2705	ADVANCED CELL BIOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course explores cellular dynamics, chromatin structure, signal transduction, cellular processes, and advanced techniques for studying cells. It covers organelle interactions, gene regulation, cell cycle, differentiation, stress responses, microscopy, DNA/RNA/protein analysis, genome instability, cell transformation, and stem cells and their applications.

Course Objectives

This Advanced Cell Biology course explores the intricacies of cellular processes and covers topics ranging from subcellular organelles, signal transduction, and stem cell applications. This course also delves into complex cell cycle regulation and apoptosis pathways. By course end, the student is expected to possess a deepened understanding of advanced cell biology, ready for research and application in contemporary scientific endeavors.

Course Outcomes (COs):

Upon successful completion of the course, students will be able to:

- Understand the dynamic organization of subcellular organelles and membrane dynamics.
- Learn chromatin structure, remodelling, and epigenetic modifications affecting gene expression.
- Learn about signal transduction pathways, intracellular transport mechanisms, and vesicular trafficking.
- Gain insights into cell cycle regulation, cellular differentiation, stress responses, and cell death mechanisms.
- Understand genome instability, cell transformation, and their implications for disease and therapeutic interventions.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Dynamic Organization of Cell • Subcellular organelles and their dynamic interactions • Membrane dynamics and vesicle trafficking • Cellular compartmentalization and its functional significance	**L1, L2**	6
Module II: Chromatin Structure and Dynamics • DNA packaging in the nucleus • Chromatin remodelling and epigenetic modifications • Regulation of gene expression through chromatin modifications	**L1, L2**	6
Module III: Cellular Signaling, Transport, and Trafficking • Signal transduction pathways and molecular cascades • Intracellular transport mechanisms • Vesicular trafficking and its role in cellular processes	**L1, L2**	6
Module IV: Cellular Processes	**L1, L2**	6

• Cell cycle regulation and checkpoints • Cellular differentiation and development • Cellular responses to stress and environmental cues • Cell death mechanisms and regulation		
Module V: Manipulating and Studying Cells • Isolation of cells and basics of cell culture • Observing cells under a microscope • Different types of microscopy techniques and their applications	**L1, L2, L3**	6
Module VI: Analyzing and Manipulating DNA, RNA, and Proteins • DNA and RNA extraction techniques • Polymerase chain reaction (PCR) and gene expression analysis • Protein isolation, purification, and analysis method	**L1, L2, L3**	6
Module VII: Genome Instability and Cell Transformation • Mechanisms of genome instability • Cell transformation and carcinogenesis • Implications for disease and therapeutic interventions	**L1, L2**	6

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2706	ECOLOGY AND EVOLUTION	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

The term environment is used to describe, in aggregate, all the external forces, influences and conditions which affect life, nature, behavior and the growth, development and maturity of living organisms. In present condition huge increase in environmental issues, have grown to complexity day by day with threat of human existence on earth. A study of environmental changes is quite essential in all types of environmental conditions to have control over urban & industrial development. It can also enlighten the masses about the importance of the protection and conservation of our environment and control of human activities which has an adverse effect on the environment. This course also emphasizes the coevolution of organisms and surroundings together with harmony for the coexistence of life on earth.

Course Objectives

This course aims to provide a comprehensive understanding of the principles of ecology and evolution and their interconnectedness. Students will explore the fundamentals of ecology, including population dynamics and community interactions, to understand the complex relationships within ecosystems. They will delve into the mechanisms of evolution, such as natural selection and genetic drift, to comprehend how biodiversity arises and changes over time. The course will also cover applied aspects of ecology and evolution, enabling students to apply theoretical knowledge to real-world issues like conservation, resource management, and the impacts of climate change on ecosystems and biodiversity. Students will also gain real world experience through field work.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand and explain the basic principles of ecology, including population dynamics, species interactions, and community structure.
- Analyse the components and functioning of ecosystems, including energy flow, nutrient cycling, and the impact of human activities on ecosystem health.
- Comprehend the mechanisms driving evolution, such as natural selection, genetic drift, and gene flow, and explain how these processes contribute to the diversity of life.
- Apply ecological and evolutionary theories to practical challenges in conservation, resource management, and assessing the ecological impacts of environmental changes.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Fundamentals of Ecology Definition, scope, and importance; Abiotic and biotic components; scales (population, species, community, ecosystems, biomes); niches and habitats. Population ecology: Population growth rate, metapopulation ecology Interactions: Ecophysiology (physiological adaptations to abiotic environment. Community ecology.	L1, L2, L3	4

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module II: Ecosystems Concept of an ecosystem, structure, and function of ecosystems: trophic levels and their interactions; nutrient cycles; primary and secondary productivity, Producers, consumers, and decomposers Energy flow in the ecosystem; Ecological succession; Food chains, food webs and ecological pyramids, introduction, types, characteristic features, structure, and function	L1, L2, L3	8
Module III: Evolution Theory & History of Evolutionary thought: Lamarckism; Darwinism; Modern Synthesis Fundamentals: Variation; heritability; natural selection; fitness and adaptation; types of selection (stabilizing, directional, disruptive) Diverse lifeforms: Origin and history of life on earth; diversity and classification of life; systems of classification (cladistics and phenetics) Interactions: Co-evolution, prey-predator interactions. Population and Quantitative genetics, molecular evolution, phylogenetics and molecular systematics Macroevolution: Species concepts and speciation; adaptive radiation; convergence; biogeography	L3, L4, L5	12
Module IV: Applied Ecology & Evolution Natural resources and associated problems Biodiversity and conservation: Importance of conserving biodiversity Conservation of biodiversity: In-situ and Ex-situ conservation of biodiversity Conservation genetics (genetic diversity, inbreeding depression); DNA fingerprinting and DNA barcoding Disease ecology and evolution: Epidemiology; antibiotic resistance; vector Control Plant and animal breeding: marker assisted breeding; genetic basis of economically important traits, global climate change: causes; consequences; mitigation Environment protection law	L3, L4, L5	12
Module V: Field Work Visit to a local area to document environmental assets-river / forest/ grassland/ hill/ mountain. Visit to a local polluted site – Urban / Rural / Industrial / Agricultural Study of common plants, insects, birds Study of simple ecosystems-pond, river, hill slopes, etc.	L3, L4, L5, L6	8

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2707	GENETICS	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

Genetics is the study of principles and mechanisms of inheritance. In this course students will understand the fundamental principles of inheritance unraveled by Gregor Mendel, who is considered the father of Genetics. Students will explore the mechanisms of inheritance in a range of organisms from bacteriophages to bacteria to yeast and higher organisms including fruit-fly, plants and humans. Students will also get introduced to concepts in population genetics and quantitative inheritance.

Course Objectives

This course aims to provide the students with a strong foundation in the knowledge and applications of principles and mechanisms of inheritance in a range of organisms including bacteriophages, bacteria, yeast, Drosophila, plants and humans. Furthermore, the basics of the principles of inheritance of quantitative traits, and the principles of inheritance at the population level will also be imparted.

Course Outcomes (COs):

On successful completion of this course, student will be able:

- Explain and analyse the genetic mechanisms of bacteria and bacteriophages, including gene transfer, mutation, and recombination.
- Interpret the role of yeast as a model organism for studying eukaryotic gene function and regulation.
- Explain the utility of *Drosophila melanogaster* as a model system to investigate genetic principles applicable to higher eukaryotes.
- Apply the principles of Mendelian inheritance in evaluating genetics crosses and determining genetic map distances in *Drosophila*.
- Apply the principles of population genetics to study the genetic structure of populations and the forces driving changes in the genetic composition of the population.
- Examine the genetic basis of complex traits and the methodologies used to identify quantitative trait loci (QTLs).
- Examine the genetic techniques underlying plant breeding.
- Conduct pedigree analysis and interpret complex pedigrees to identify modes of inheritance and calculate genetic risks for individuals.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Genetics of bacteria and bacteriophages Concept of a gene in pre-DNA era; mapping of genes in bacterial and phage chromosomes by classical genetic crosses; fine structure analysis of a gene; genetic complementation and other genetic crosses using phenotypic markers; phenotype to genotype connectivity prior to DNA-based understanding of gene	L1, L2, L3	4
Module II: Yeast genetics Meiotic crosses, tetrad analyses, non-Mendelian and Mendelian ratios, gene conversion, models of genetic recombination, yeast mating type switch; dominant and recessive genes/mutations, suppressor or modifier screens, complementation groups, transposon mutagenesis, synthetic lethality, genetic epistasis.	L1, L2, L3	4

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Tetrad analysis in Neurospora		
Module III: Drosophila genetics as a model of higher eukaryotes Monohybrid & dihybrid crosses, back-crosses, test-crosses, analyses of autosomal and sex linkages, screening of mutations based on phenotypes and mapping the same (three-point-crossover mapping), hypomorphy, genetic mosaics, genetic epistasis in context of developmental mechanism;	L1, L2, L3, L4	8
Module IV: Population genetics and genetics of evolution Introduction to the elements of population genetics: genetic variation, genetic drift, neutral evolution; mutation selection, balancing selection, Fishers theorem, Hardy- Weinberg equilibrium, linkage disequilibrium; in-breeding depression & mating systems; population bottlenecks, migrations,	L1, L2, L3	5
Module V: Quantitative genetics of complex traits (QTLs) Complex traits, mapping QTLs, yeast genomics to understand biology of QTLs.	L1, L2, L3, L4	3
Module VI: Plant genetics Laws of segregation in plant crosses, inbreeding, selfing, heterosis, maintenance of genetic purity, gene pyramiding.	L1, L2, L3	2
Module VII: Human Pedigree analysis Modes of Inheritance, prediction of probability of progeny genotype based on pedigree analysis	L1, L2, L3, L4, L5	4

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2708	BASICS OF CHEMISTRY AND PHYSICS	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course will explore the essential principles of physics and chemistry through the lens of biology. Tailored for non-majors, this class aims to provide a solid foundation in the physical and chemical concepts crucial to understanding biological processes.

Course Objectives

In this course, students will delve into the key principles that underpin biological phenomena including topics on Classical Mechanics, Wave & Optics, Electricity & Magnetism, and Thermodynamics. Topics include classical mechanics, chemical reactions in biological systems, and the application of thermodynamics to biological processes.

Through interactive lectures, and real-world examples, students will gain practical insights into how physics and chemistry shape the living world.

Course Outcomes (COs):

This course will enable the students to attain the following:

- Explore fundamental concepts such as motion, forces, and energy to develop a foundational understanding of the physical principles governing biological systems.
- Explain the fundamental principles in waves & optics, and electricity and magnetism, along with the relevance of these principles in the various tools used in biological research.
- Examine Chemical Processes in Biological Systems including enzyme catalysis and cellular metabolism, to comprehend how chemical interactions drive biological functions at the molecular level.
- Gain proficiency in applying thermodynamic principles to analyze energy transfer and transformations within living organisms, emphasizing their relevance to cellular processes and homeostasis.
- Develop problem-solving skills by applying both physics and chemistry concepts to address real-world biological challenges.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Importance of Physics in Biology • Importance of Physics in understanding biological processes	L1, L2	1
Module II: Mechanics: Motion and Forces • Kinematics (1D and 2D motions) • Dynamics: Newton's laws of motion; • Application of Newton's 2nd law in Linear, Circular motions (briefly, mention other kinds of motion – rotational and oscillatory (e.g. SHM)) • Principle of Conservation of Energy • Principle of Conservation of Momentum	L1, L2, L3	5
Module III: Waves and Optics in Biological Systems • Basics of wave motion • Light as a wave	L1, L2, L3	4

Prof. (Dr.) Anil Kumar

• Ability of light to cause atomic excitation and its Biological significance (e.g. • Biofluorescence, Photosynthesis) • Applications of optics in biology (e.g., Compound microscopy, Confocal microscopy, Fluorescence microscopy)		
Module IV: Electricity and Magnetism in Biological Systems • Basics of electricity and magnetism • Membrane potentials and electrical signaling in cells • Magnetic resonance imaging (MRI) in biological research	L1, L2	3
Module V: Introduction to Chemistry in Biology • Overview of the course content • Importance of chemistry in biological processes • Basic chemical terminology and concepts	L1, L2	1
Module VI: Section: Organic Chemistry **Structure, Bonding and Nomenclature in Organic Molecules** • Structure & nomenclature of organic molecules • Bonding in organic compounds • Isomerism in organic chemistry	L1, L2	2
Module VII: Functional Groups and Reactions • Common functional groups in biomolecules (aldehyde, ketone, alcohol, acid, amine, amide, ester) • Chemical reactions in organic chemistry • Stereochemistry in biomolecules	L1, L2	2
Module VIII: Section: Physical Chemistry **Thermodynamics in Biological Systems** • First and Second Laws of Thermodynamics • Enthalpy, entropy, and Gibbs free energy • Thermodynamics of biological processes	L1, L2	3
Module IX: Chemical kinetics • Zero, First and Second order reactions	L1, L2	3
Module X: Instrumental analysis • GC/MS, LC/MS, NMR	L1, L2, L3	1

Module XI: Colligative Properties
• Definition of colligative properties
• Different ways of expressing concentration of a solution
• Importance of colligative properties in biological systems
  • Osmosis; Osmotic pressure and its significance in cells
  • Freezing Point Depression and Cryopreservation
	L1, L2, L3	3

Module XII: Section : Inorganic Chemistry **Metals in Biological Systems** • Role of metal ions in biological processes • Metalloenzymes and metalloproteins • Oxidation state of atoms and its importance in bioavailability of micronutrients	L1, L2	2

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

DBLS2739	BASICS OF RESEARCH METHODOLOGY, ETHICS, AND RESEARCH COMMUNICATION	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	NIL				
Co-requisites					

Catalog Description

This course aims to provide students with a comprehensive understanding of conducting ethical research, utilizing proper research methodologies, and effectively communicating research findings. The course includes a final project where students will write a Literature Review on a topic chosen in consultation with the teacher(s).

This course is designed to equip students with essential skills and knowledge to conduct ethical research, employ proper research methodologies, and effectively communicate scientific information (with focus on writing a literature review). The course will cover topics such as research design, data collection and analysis, research ethics, and science communication strategies. Through a combination of lectures, discussions, case studies, and practical exercises, students will develop a deeper understanding of the research process and its ethical implications.

Course Objectives

The objective of this course is to impart knowledge about various stages of research process, research ethics and different ways of research communication.

The aim of this course is to impart research skills to the beginners and help to improve the quality of research by the existing researchers. It also encompasses the understanding and application of appropriate research design, statistics, and the use of the computer for reference management, report writing, research paper writing and presentation. The course also introduces the key conceptual issues of each research method, as well as giving practical guidance. It covers the series of research methodology contents: from problem formulation, to design, to data collection, analysis, reporting and dissemination. The course has the dual aims of equipping students with conceptual understandings of current academic debates regarding different methods, and the practical skills to put those methods into practice.

Course Outcomes

On completion of this course, the students will be able to

CO1. Define criteria of good research, steps in research process, and data collection.

CO2. Identify different types of sampling and its purpose.

CO3. Conduct hypothesis testing for different types of samples and interpret the results.

CO4: Learn the importance of literature review, write research paper/thesis, use reference management software.

Course Content :

Module	Topic	**Blooms level***	Hours
1	**Research Methodology** Understanding the research process: From research questions to conclusions	L1, L2	10

SEMESTER-VIII

Course Code: DBLS2801	DOWN STREAM PROCESSING & FERMENTATION TECHNOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course explains the processes and techniques used for production and purification of a product from culture medium. Also, bioprocess consideration in using animal and plant cell cultures will discuss using different techniques. This will also provide students with an up-to-date knowledge of upstream and downstream processing technology.

Course Objectives

The syllabus will help the students to characterize the Bioproducts of biotechnological importance and to get expertise in their downstream processing. The course shall make the students aware of various fermentation processes within the context of each topic.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Produce bio-products and secondary metabolites on commercial level using fermenters.
- Describe the production of primary and secondary metabolites.
- Recognize the fundamental understanding of physical and chemical properties of biological materials and their separation and purification.
- Explain the various principles that underlie major unit operations used in bio separations such as settling, evaporation, centrifugation, and membrane filtration.
- Explain the principles of protein precipitation, aqueous two phase extraction, adsorption and chromatography.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Fermentation Technology-An Overview • Basic principle in fermentation technology, • Media formulation and optimization, • Cell culture techniques • Inoculum development and aseptic transfers.	**L1, L3, L4, L5**	3
Module II: Bioproduct Production • Production of Ethanol, • Production of secondary metabolites – penicillin, cephalosporins, streptomycin, tetracycline, • Fermentation technology for production of acetone-butanol, citric acid, amino acids, • Polysaccharides and plastics.	**L1, L2, L3**	9
Module III: Downstream Processing-An Overview • Importance of downstream processing in biotechnology; • Characteristics of bio-products and fermentation broth	**L1, L3, L4,**	2

Prof. (Dr.) Anil Kumar

Course Code: DBLS2802	INTRODUCTION TO DEVELOPMENTAL BIOLOGY	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

Developmental Biology is a branch of biological sciences that focuses on understanding the processes by which organisms grow and develop from a single cell (zygote) into a fully formed organism. This field integrates principles from molecular biology, genetics, and cell biology to elucidate the mechanisms that control the growth, differentiation, and morphogenesis of cells, tissues, and organs. This course introduces the students to molecular, cellular, and physiological processes that govern development in multicellular organisms. Students will examine key concepts from gamete formation, fertilization, embryonic development, repair and regeneration. Students will also explore current research topics in Stem cell engineering and Stem cell therapy.

Course Objectives

This course aims to enable the students to develop an integrated understanding of the molecular, cellular, genetic and physiological processes that govern development in multicellular organisms. Significant emphasis will be on the scientific process and key experiments that helped scientists unravel the secrets of the development processes in various model organisms.

Course Outcomes (COs):

Upon successful completion of this course students will be able to:

- Describe the different stages of development in multicellular organisms (from formation of gametes to development of a fully developed organism).
- Explain the different molecular and cellular processes involved in regulation of development in higher organisms, with suitable example
- Develop an integrated understanding of knowledge gained in fundamental courses such as genetics, cell biology and molecular biology, in the context of the various cellular, molecular and physiological processes that regulate the development of a multicellular organism.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Developmental Biology in higher organisms Life cycle and stages of development Introduction to key themes in Developmental Biology: Differential gene expression, Cell fate determination, Signalling in development, Pattern formation, Morphogenesis, Developmental plasticity: Regeneration, Apoptosis (programmed cell death)	L1, L2	7
Module II: Germ Cells and Fertilization The Benefits of Sex Reproduction in higher organisms, Primordial Germ Cells and Sex Determination in Mammals, Eggs, Sperm, Fertilization, Blastulation, Gastrulation.	L1, L2	8
Module III: Universal Mechanisms of Animal & Plant Development • Differential gene expression • Cell-Cell signalling • Cell fate determination • Patterning: axis formation and segmentation	L1, L2, L4, L5	30

Prof. (Dr.) Anil Kumar

Course Code: DBLS2803	METHODS IN BIOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

This course introduces the learners to the various techniques and methods used in biology and helps them to strengthen their theoretical knowledge before practical training. This course gives an overview about the different methods used in laboratory and prepare the students for the laboratory experiments. The knowledge about the statistical methods teaches the students to interpret the data.

Course Objectives

The objective of this course is to acquaint the students with various techniques in biology. A student will build upon undergraduate level knowledge of biological principles to understand different biological techniques. The course shall also make the students aware of various statistical techniques used in biology

Course Outcomes (COs):

On completion of this course, students should be able to:

- Explain the principles of buffer preparation and function, and evaluate buffer capacities and pH adjustment for various biological experiments.
- Develop proficiency in a range of analytical techniques, such as spectrophotometry, chromatography, and electrophoresis, for the quantitative and qualitative analysis of biological molecules.
- Explain and apply microbiological methods, including culturing, isolating, and identifying microorganisms, as well as maintaining sterile techniques.
- Apply statistical methods to analyze and interpret biological data, understanding concepts such as hypothesis testing, data visualization, and the use of statistical software.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Buffers: Principle, constitution and preparation of Buffers (acidic, neutral and basic), Biological buffer systems.	**L1, L2, L3**	4
Module II: Analytical Techniques: Principle, instrumentation, applications, analysis and interpretation of the data in UV-Visible Spectrophotometry, Fluorimetry, Chromatography (Paper, TLC, Gel filtration, Ion-exchange chromatography), Electrophoresis (Gel electrophoresis, SDS-PAGE, Agarose Gel Electrophoresis, Immunoelectrophoretic techniques).	**L1, L2, L3, L4**	8
Module III: Microbiological Techniques: Culture of microorganisms; types of culture media; methods for isolating pure cultures; maintenance and preservation of pure cultures. Control of microorganisms; physical and chemical methods. Bacterial growth: definition, growth parameters, measurement of growth, synchronous growth. Batch and continuous cultures	**L1, L2, L3, L4**	8
Module IV: Biostatistics Importance of the use of statistical methods in biological research, sampling theory, samples and populations. Measures of central tendency; mean, median,	**L1, L2, L3, L4**	8

Course Code: DBLS2804	GENETIC ENGINEERING	L	T	P	C
Version	2023	3	0	0	3
Pre-requisites	Nil				
Co-requisites	**DBTH2805 GENETIC ENGINEERING LAB**				

Catalog Description

The objectives of this course are to teach students various approaches to conducting genetic engineering and their applications in biological research as well as in biotechnology industries. Genetic engineering is a technology that has been developed based on our fundamental understanding of the principles of molecular biology and this is reflected in the contents of this course.

Course Objectives

Given the impact of genetic engineering in modern society, the students should be endowed with strong theoretical knowledge of this technology. In conjunction with the practicals in molecular biology & genetic engineering, the students should be able to take up biological research as well as placement in the relevant biotech industry

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the fundamental principles of genetic engineering and become proficient in the tools and techniques used in genetic manipulation, such as restriction enzymes and cloning strategies.
- Explain the utility of various types of vectors, including plasmids, viral vectors, and artificial chromosomes, and their applications in gene cloning and expression.
- Discuss in detail the relevant applications of a range of PCR techniques, such as quantitative PCR, reverse transcription PCR, and digital PCR, for amplifying and analyzing DNA sequences.
- Articulate the application of gene manipulation methods and techniques for studying protein-DNA interactions, such as electrophoretic mobility shift assays (EMSAs) and chromatin immunoprecipitation (ChIP).
- Explain the principles and applications of gene silencing methods, including RNA interference, and master genome editing technologies such as CRISPR-Cas9, TALENs, and zinc finger nucleases.
- Explain the principles and applications of stem cell technology and gene therapy, focusing on their potential for treating genetic disorders and regenerative medicine.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction and tools for genetic engineering Impact of genetic engineering in modern society; general requirements for performing a genetic engineering experiment; restriction endonucleases and methylases; DNA ligase, Klenow enzyme, T4 DNA polymerase, polynucleotide kinase, alkaline phosphatase; cohesive and blunt end ligation; linkers; adaptors; homopolymeric tailing; labelling of DNA: nick translation, random priming, radioactive and non-radioactive probes, hybridization techniques: northern, southern, south-western and far-western and colony hybridization, fluorescence in situ hybridization.	**L1, L2**	7
Module II: Different types of vectors	**L1, L2, L3**	10

Plasmids; Bacteriophages; M13 mp vectors; PUC19 and Bluescript vectors, hagemids; Lambda vectors; Insertion and Replacement vectors; Cosmids; Artificial chromosome vectors (YACs; BACs); Principles for maximizing gene expression expression vectors; pMal; GST; pET-based vectors; Protein purification; His-tag; GST-tag; MBP-tag etc.; Intein-based vectors; Inclusion bodies; methodologies to reduce formation of inclusion bodies; mammalian expression and replicating vectors; Baculovirus and Pichia vectors system, plant based vectors, Ti and Ri as vectors, yeast vectors, shuttle vectors		
Module III: Different types of PCR techniques Principles of PCR: primer design; fidelity of thermostable enzymes; DNA polymerases; types of PCR – multiplex, nested; reverse-transcription PCR, real time PCR, touchdown PCR, hot start PCR, colony PCR, asymmetric PCR, cloning of PCR products; T-vectors; proof reading enzymes; PCR based site specific mutagenesis; PCR in molecular diagnostics; viral and bacterial detection; sequencing methods; enzymatic DNA sequencing; chemical sequencing of DNA; automated DNA sequencing; RNA sequencing; chemical synthesis of oligonucleotides; mutation detection: SSCP, DGGE, RFLP.	**L1, L2, L3**	10
Module IV: Gene manipulation and protein-DNA interaction Insertion of foreign DNA into host cells; transformation, electroporation, transfection; construction of libraries; isolation of mRNA and total RNA; reverse transcriptase and cDNA synthesis; cDNA and genomic libraries; construction of microarrays – genomic arrays, cDNA arrays and oligo arrays; study of protein-DNA interactions: electrophoretic mobility shift assay; DNase footprinting; methyl interference assay, chromatin immunoprecipitation; protein-protein interactions using yeast two-hybrid system; phage display.	**L1, L2, L3, L4**	6
Module V: Gene silencing and genome editing technologies Gene silencing techniques; introduction to siRNA; siRNA technology; Micro RNA; construction of siRNA vectors; principle and application of gene silencing; gene knockouts and gene therapy; creation of transgenic plants; debate over GM crops; introduction to methods of genetic manipulation in different model systems e.g. fruit flies (*Drosophila*), worms (*C. elegans*), frogs (Xenopus), fish (zebra fish) and chick; Transgenics - gene replacement; gene targeting; creation of transgenic and knock-out mice; disease model; introduction to genome editing by CRISPR-CAS with specific emphasis on Chinese and American clinical trials	**L3, L4, L5, L6**	7
Module VI: Stem cell and gene therapy, Types of stem cell, their use, gene therapy	**L1, L2, L3**	5

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2805	GENETIC ENGINEERING LAB	L	T	P	C
Version	2023	0	0	2	1
Pre-requisites	Nil				
Co-requisites	**DBLS2804 GENETIC ENGINEERING**				

Catalog Description

This course will help the students to better understand what has been taught in the theory class. Designing primers, doing PCR, cloning PCR products will make the theoretical concepts about PCR and cloning crystal clear. Further purification of recombinant proteins, running of SDS-PAGE, western blotting will be helpful for understanding the regulation of expression and understanding molecular biology techniques.

Course Objectives

The objective of this course is to give students hands on experience of the latest techniques in genetic engineering. It will also help them to understand the theoretical concepts better.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Develop the skills to design effective primers and perform PCR amplification to successfully target and amplify a gene for expression purposes.
- Acquire the ability to clone a PCR-amplified gene into an *E. coli* expression vector, including the preparation of competent cells and transformation techniques.
- Apply the principle of gene expression induction using inducers and optimize gene expression in *E. coli*.
- Gain proficiency in preparing and running SDS-PAGE gels to separate and analyze proteins, assessing the expression of the target recombinant protein.
- Master the technique of Western blotting, including transfer, blocking, antibody probing, and detection to identify and quantify the recombinant protein.
- Develop the capability to purify the recombinant protein using chromatography techniques and evaluate the purity and concentration of the final product.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Designing of primers and PCR amplification of a gene for expression	L1, L2, L3	2
Module II: Cloning of the gene in E. coli expression vector	L1, L2, L3	4
Module III: Induction of gene expression	L2, L3	2
Module IV: Running of SDS-PAGE to check expression	L1, L2, L3	2
Module V: Western blotting of the recombinant protein	L2, L3, L4	2
Module VI: Purification of the recombinant protein	L1, L2, L3, L4	3

**Bloom's Level: L1-Knowledge; L2-Comprehension; L3-Application; L4-Analysis; L5-Synthesis, L6-Evaluation*

Course Code: DBLS2806	MOLECULAR DIAGNOSTICS	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Nil				
Co-requisites	Nil				

Catalog Description

Molecular Diagnostics familiarizes students about recent advances in molecular biology and molecular medicine with a potential to profoundly alter many aspects of modern medicine including pre- or post-natal analysis of genetic diseases and identification of individuals predisposed to disease ranging from common cold to cancer. Students should be able to understand various facets of molecular procedures and basics of genomics, proteomics and metabolomics that could be employed in early diagnosis and prognosis of human diseases.

Course Objectives

Molecular Diagnosis is the process of identifying a disease by studying molecules, such as proteins, DNA, and RNA, in a tissue or fluid. It is a new discipline that captures genomic and proteomic expression patterns and uses the information to distinguish between two or more conditions at the molecular level. The conditions under investigation can be human genetic disease or infectious diseases. Molecular diagnostics is not confined to human diseases but can be used in animals or plants

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand the significance of the classical discoveries in Molecular Diagnostics, and explain the uses of the same in modern context
- Compare the modern-day Molecular Diagnostic technologies with the technologies used earlier, and explain their significance in the modern advancements.
- Describe the key uses of Molecular Diagnostics tests in microbial diseases, metabolic pathway impairments and paediatric diseases.
- Explain the role of DNA mutations, polymorphisms and chromosomal abnormalities in diseases and how Molecular Diagnostic tests can identify these.
- Recognise the impact of Molecular Diagnostic tests in rapid, easy, high throughput disease diagnostics
- Enlist and explain the ever-increasing list of Molecular Diagnostics applications in biotechnology, precision medicine and prenatal diagnostics.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Introduction to Molecular Diagnostics. Genome biology in health and disease DNA, RNA, Protein: chromosomal structure & mutations; DNA polymorphism: human identity; clinical variability and genetically determined adverse reactions to drugs.	**L1, L2, L3**	5
Module II: Techniques used: Hybridization based techniques, Southern, Western, FISH, PCR, PCR based techniques, RT-PCR, Multiplex, DNA fingerprinting, sequencing, new generation sequencing, RNA sequencing, Microarray, Bioinformatics data acquisition & analysis.	**L1, L2, L3**	5
Module III: Diagnostic metabolomics Metabolite profile for biomarker detection the body fluids/tissues in various metabolic disorders by making using LC MS & NMR technological platforms.	**L3, L4, L5**	5

Course Code: DBLS2807	ENVIRONMENTAL BIOTECHNOLOGY	L	T	P	C
Version	2023	2	0	0	2
Pre-requisites	Ecology and Environment				
Co-requisites	Nil				

Catalog Description

Environmental Biotechnology" offers an in-depth exploration of how biotechnological methods can address pressing environmental challenges. This course equips students with the knowledge and skills to develop innovative biotechnological solutions for a sustainable future

Course Objectives

The course "Environmental Biotechnology" aims to provide students with a comprehensive understanding of the intersection between biotechnology and environmental science. Through six detailed modules, students will explore critical environmental issues, the development and use of bioenergy resources, and the methods for pollution control and waste treatment. They will gain expertise in bioremediation and biodegradation techniques, which utilize biological systems to address environmental contaminants. The course will also emphasize green practices for sustainable development, encouraging the adoption of eco-friendly technologies and strategies. Additionally, students will examine environmental protection policies, understanding their role in promoting sustainability and conserving natural resources.

Course Outcomes (COs):

On completion of this course, students should be able to:

- Understand and articulate the major environmental issues, including pollution, climate change, and biodiversity loss, and their impact on ecosystems and human health.
- Analyse various bioenergy resources, such as biofuels and biomass, and evaluate their potential and challenges in replacing fossil fuels.
- Develop an understanding of different types of pollution and waste, and explain the principles and techniques for effective waste treatment and pollution control.
- Discuss bioremediation and biodegradation processes, and apply microbial and plant-based strategies to detoxify and restore contaminated environments.
- Explore and assess green practices and technologies aimed at promoting sustainable development, reducing environmental impact, and conserving natural resources.
- Understand the key environmental protection policies and regulations, and evaluate their effectiveness in safeguarding the environment and promoting sustainable practices.

Course Content:

Modules	Blooms level*	Number of hours
Module I: Environmental issues Greenhouse effect, Global Warming, Global Ozone Problem, Acid Rain, Eutrophication and Biomagnification	L1, L2, L3	3
Module II: Bioenergy Resources Renewable and Non-Renewable energy resources Clean fuel technology and generations of Biofuels- Bioethanol, Biogas, Biodiesel, Algal fuels.	L1, L2, L3	6
Module III: Pollutions & Waste treatment	L3, L4, L5	7

DBLS2839	DATA ANALYSIS & VISUALISATION USING SOFTWARE	L	T	P	C
Version 1	Date of Approval:	4	0	0	4
Pre-requisites/Exposure	Class X Mathematics				
Co-requisites					

Catalog Description

The implosion of available data has made visualization more critical but also more challenging. Data analysis and Data Visualization are essential tools for business analysis, engineers, policymakers, and decision-makers. Developed originally for "small data", visualization techniques have been met with varied success in the past centuries and decades. There are a few well-known visualizations that are very effective in capturing the essence of the data, and of course, there are many infamous negative examples of poor visuals. An effective visual is critical for decision making it, but it also requires a lot of work, customization, attention to detail, and refinements.

Course Objectives

The course is designed to help students develop skills and knowledge in the following area(s):

- Develop an understanding of what is a good visualization for a given purpose
- Learn visualization theory & techniques
- Build a substantial data analytic project
- Apply data analysis and visualization with Excel, SPSS, R, Python, NVivo and MATLAB

Course Outcomes

On completion of this course, the students will be able to

CO1. Students will be able to articulate meaningful lines of inquiry that might be explored through the collection, organization, visualization, and analysis of data in a context associated with their primary field of study using (as appropriate) numerical, textual, spatial, and/ or visual data.

CO2. Student will understand what data are, how they are collected, and how to assess the quality/ reliability of data.

CO3. Students will demonstrate intermediate proficiency in the visualization of data to communicate information and patterns that exist in the data.

CO4: Students will be able to use at beginning level of proficiency the tools of statistics and machine learning to ask questions of and explore patterns in data.

Course Content :

Module	Topics Covered	Blooms Level	Contact Hours
1	**Module-1: Introduction to Excel** Data Analysis using Excel, Curve fitting, Correlation, Linear Regression, Multiple regression, Principal Component Analysis and Factor Analysis, Hypothesis testing **Introduction to Excel and SPSS** Introduction to SPSS and Types of Data, Importing, exporting and data handling in SPSS; Exploratory data analysis using SPSS and data visualization;	L1, L2, L3, L4	20 hours

	Introduction to statistical inference and various univariate tests by using SPSS; Analysis of Variance (One Way ANOVA, Two Way ANOVA and ANCOVA); Correlation, Simple and Multiple linear Regression Analysis; Principal Component Analysis and Factor Analysis		
2	**Module-2: VOS Viewer** **Web of Science, Scopus, Dimensions, Lens, and PubMed.** Co-authorship networks, citation-based networks, and co-occurrence networks can be created based on data downloaded from Web of Science, Scopus, Dimensions, and Lens. Co-authorship networks and co-occurrence networks can also be created based on PubMed data. **Crossref, Europe PMC, and OpenAlex**. Networks can also be created based on data retrieved through the APIs of Crossref, Europe PMC, and OpenAlex, These APIs can be queried interactively in VOS viewer. **Semantic Scholar, Open Citations, and Wiki Data.** For a given set of DOIs, networks can also be created based on data retrieved through the APIs of Semantic Scholar, Open Citations and Wiki Data.	L1, L2, L3, L4	10 Hours
3	**Faculty of Management Studies & Behavioural Sciences** **Module 3: Domain Specific Software** **- Structural Equation Modelling** **Smart PLS** Introduction to Structural Equation Modelling (SEM), Introduction to the software's AMOS and SPSS, SMART PLS, Testing of Statistical assumptions, Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), common method bias (CMB) test, Measurement Model Assessment, Discussing Fit Indices, Reliability and Validity Testing, Structural Model Assessment identifying multivariate outlier, Construct Validity: Convergent and Discriminant Validity, Measurement Model & Structural Equation Modelling, Mediation and Moderation Effects, Multi-Group Analysis.	L1, L2, L3, L4	30 Hours
	Faculty of Arts **N Vivo** 1. Import text, audio, video, emails, images, spreadsheets, online surveys, web content, and social media from various sources into a simple, intuitive interface.

INTRODUCTION TO COMPUTERS AND PROGRAMMING IN C

Course Code: BTE2104 **Credit Units: 03**

Course Objective:
The objective of this course module is to acquaint the students with the basics of computers system, its components, data representation inside computer and to get them familiar with various important features of procedure oriented programming language i.e. C.

Course Contents:

Module I: Introduction
Introduction to computer, history, von-Neumann architecture, memory system (hierarchy, characteristics and types), H/W concepts (I/O Devices), S/W concepts (System S/W & Application S/W, utilities). Data Representation: Number systems, character representation codes, Binary, octal, hexadecimal and their interconversions. Binary arithmetic, floating point arithmetic, signed and unsigned numbers, Memory storage unit.

Module II: Programming in C
History of C, Introduction of C, Basic structure of C program, Concept of variables, constants and data types in C, Operators and expressions: Introduction, arithmetic, relational, Logical, Assignment, Increment and decrement operator, Conditional, bitwise operators, Expressions, Operator precedence and associativity. Managing Input and output Operation, formatting I/O.

Module III: Fundamental Features in C
C Statements, conditional executing using if, else, nesting of if, switch and break Concepts of loops, example of loops in C using for, while and do-while, continue and break. Storage types (automatic, register etc.), predefined processor, Command Line Argument.

Module IV: Arrays and Functions
One dimensional arrays and example of iterative programs using arrays, 2-D arrays Use in matrix computations.
Concept of Sub-programming, functions Example of user defined functions. Function prototype, Return values and their types, calling function, function argument, function with variable number of argument, recursion.

Module V: Advanced features in C
Pointers, relationship between arrays and pointers Argument passing using pointers, Array of pointers. Passing arrays as arguments.
Strings and C string library.
Structure and Union. Defining C structures, Giving values to members, Array of structure, Nested structure, passing strings as arguments.
File Handling.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

CT: Class Test, HA: Home Assignment, S/V/Q: Seminar/Viva/Quiz, EE: End Semester Examination; Att: Attendance

ELECTRICAL SCIENCE

Course Code: BTE2106 **Credit Units: 03**

Course Objective:
The objective of the course is to provide a brief knowledge of Electrical Engineering to students of all disciplines. This Course includes some theorems related to electrical, some law's related to flow of current, voltages, basic knowledge of Transformer, basic knowledge of electromagnetism, basic knowledge of electrical network.

Course Contents:

Module I: Basic Electrical Quantities
Basic Electrical definitions-Energy, Power, Charge, Current, Voltage, Electric Field Strength, Magnetic Flux Density, etc., Resistance, Inductance and Capacitance. Ideal Source, Independent Source and Controlled Source

Module II: Network Analysis Techniques & Theorems
Circuit Principles: Ohm's Law, Kirchoff's Current Law, Kirchoff's Voltage Law Network Reduction: Star–Delta Transformation, Source Transformation, Nodal Analysis, Loop analysis. Superposition theorem, Thevenin's Theorem, Norton's theorem and Reciprocity theorem.

Module III: Alternating Current Circuits
Peak, Average and RMS values for alternating currents, Power calculation:
reactive power, active power, Complex power, power factor, impedance, reactance, conductance, susceptance Resonance: series Resonance, parallel resonance, basic definition of Q factor & Band-width.

Module IV: Transformers
Basic Transformer Operation principle, Construction, Voltage relations, current relations, Linear circuit models, open circuit test, short circuit test, Transformer Efficiency.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

PROGRAMMING IN C LAB

Course Code: BTE2108 **Credit Units: 01**

Software Required: Turbo C

Course Contents:

- C program involving problems like finding the nth value of cosine series, Fibonacci series. Etc.
- C programs including user defined function calls
- C programs involving pointers, and solving various problems with the help of those.
- File handling

Examination Scheme:

IA				EE	
A	**PR**	**LR**	**V**	**PR**	**V**
5	10	10	5	35	35

Note: IA –Internal Assessment, EE- External Exam, PR- Performance, LR – Lab Record, V – Viva.

Course Code: BTE2110 **Credit Units: 01**

List of Experiments:

- To verify KVL & KCL in the given network.
- To verify Superposition Theorem.
- To verify Maximum Power Transfer Theorem.
- To verify Reciprocity Theorem.
- To determine and verify RTh, VTh, RN, IN in a given network.
- To perform open circuit & short circuit test on a single-phase transformer.
- To study transient response of a given RLC Circuit.
- To perform regulation, ratio & polarity test on a single-phase transformer.
- To measure power & power factor in a three phase circuit by two wattmeter method.
- To measure power & power factor in a three phase load using three ammeter& three voltmeter method.

ENGINEERING CHEMISTRY LAB

Course Code: BTE2113 **Credit Units: 01**

Course Contents:

List of Experiments:(Any 10 Experiments)

1. To determine the ion exchange capacity of a given cation exchanger.
2. To determine the temporary, permanent and total hardness of a sample of water by complexometric titration method.
3. To determine the type and extent of alkalinity of given water sample.
4. To determine the number of water molecules of crystallization in Mohr's salt (ferrous ammonium sulphate) provided standard potassium dichromate solution (0.1N) using diphenylamine as internal indicator.
5. To determine the ferrous content in the supplied sample of iron ore by titrimetric analysis against standard $K_2Cr_2O_7$ solution using potassium ferricyanide $[K_3Fe(CN)_6]$ as external indicator.
6. (a) To determine the surface tension of a given liquid by drop number method.

(b) To determine the composition of a liquid mixture A and B (acetic acid and water) by surface tension method.

7. To prepare and describe a titration curve for phosphoric acid – sodium hydroxide titration using pH-meter.
8. (a) To find the cell constant of conductivity cell.

(b) Determine the strength of hydrochloric acid solution by titrating it against standard sodium hydroxide solution conductometrically

9. Determination of Dissolved oxygen in the given water sample.
10. To determine the total residual chlorine in water.
11. Determination of amount of oxalic acid and H_2SO_4 in 1 L of solution using N/10 NaOH and N/10 $KMnO_4$ solution.
12. Determination of viscosity of given oil by means of Redwood viscometer I.
13. To determine flash point and fire point of an oil by Pensky Martin's Apparatus
14. To determine the Iodine value of the oil.

OBJECT ORIENTED PROGRAMMING IN C++

Course Code: BTE2203 **Credit Units: 03**

Course Objective:
The objective of this module is to introduce object oriented programming. To explore and implement the various features of OOP such as inheritance, polymorphism, Exceptional handling using programming language C++. After completing this course student can easily identify the basic difference between the programming approaches like procedural and object oriented.

Course Contents:

Module I: Introduction
Review of C, Difference between C and C++, Procedure Oriented and Object Oriented Approach. Basic Concepts: Objects, classes, Principals like Abstraction, Encapsulation, Inheritance and Polymorphism. Dynamic Binding, Message Passing. Characteristics of Object-Oriented Languages.Introduction to Object-Oriented Modeling techniques (Object, Functional and Dynamic Modeling).

Module II: Classes and Objects
Abstract data types, Object & classes, attributes, methods, C++ class declaration, Local Class and Global Class, State identity and behaviour of an object, Local Object and Global Object, Scope resolution operator, Friend Functions, Inline functions, Constructors and destructors, instantiation of objects, Types of Constructors, Static Class Data, Array of Objects, Constant member functions and Objects, Memory management Operators.

Module III: Inheritance
Inheritance, Types of Inheritance, access modes – public, private & protected, Abstract Classes, Ambiguity resolution using scope resolution operator and Virtual base class, Aggregation, composition vs classification hiérarchies, Overriding inheritance methods, Constructors in derived classes, Nesting of Classes.

Module IV: Polymorphism
Polymorphism, Type of Polymorphism – Compile time and runtime, Function Overloading, Operator Overloading (Unary and Binary) Polymorphism by parameter, Pointer to objects, this pointer, Virtual Functions, pure virtual functions.

Module V: Strings, Files and Exception Handling
Manipulating strings, Streams and files handling, formatted and Unformatted Input output. Exception handling, Generic Programming – function template, class Template Standard Template Library: Standard Template Library, Overview of Standard Template Library, Containers, Algorithms, Iterators, Other STL Elements, The Container Classes, General Theory of Operation, Vectors.

Examination Scheme:

Components	A	CT	S/V/Q	HA	EE
Weightage (%)	5	10	8	7	70

OBJECT ORIENTED PROGRAMMING IN C++ LAB

Course Code: BTE2205 **Credit Units: 01**

Software Required: Turbo C++

Course Contents:

- Creation of objects in programs and solving problems through them.
- Different use of private, public member variables and functions and friend functions.
- Use of constructors and destructors.
- Operator overloading
- Use of inheritance in and accessing objects of different derived classes.
- Polymorphism and virtual functions (using pointers).
- File handling.

Examination Scheme:

ENGINEERING GRAPHICS LAB

Course Code: BTE2206 **Credit Units: 01**

Course Objective:
This course will provide students concepts on the drawings of different curves like straight line, parabola, ellipse etc. After completion of this course, students will be able to draw different figures manually and will be capable of using various instruments involved in drawings.

Course Contents:

Module I: General
Importance, Significance and scope of engineering drawing, Lettering, Dimensioning, Scales, Sense of proportioning, Different types of projections, Orthographic Projection, B.I.S. Specifications.

Module II: Projections of Point and Lines
Introduction of planes of projection, Reference and auxiliary planes, projections of points and Lines in different quadrants, traces, inclinations, and true lengths of the lines, projections on Auxiliary planes, shortest distance, intersecting and non-intersecting lines.

Module III: Planes other than the Reference Planes
Introduction of other planes (perpendicular and oblique), their traces, inclinations etc., Projections of points and lines lying in the planes, conversion of oblique plane into auxiliary Plane and solution of related problems.

Module IV: Projections of Plane Figures
Different cases of plane figures (of different shapes) making different angles with one or both reference planes and lines lying in the plane figures making different given angles (with one of both reference planes). Obtaining true shape of the plane figure by projection.

Module V: Projection of Solids
Simple cases when solid is placed in different positions, Axis faces and lines lying in the faces of the solid making given angles.

Module VI:Development of Surface
Development of simple objects with and without sectioning. Isometric Projection

LIFE SCIENCES

Course Code: BTE2210 **Credit Units: 03**

Course Objective:
The objective of the course is to provide students an understanding of the very basic molecules of life-DNA,RNA, proteins and how these molecules, when form further complex molecules like carbohydrates, vitamins and lipids, then functioning of body takes place. Since technology is advancing in every field, emphasis is also given on the understanding of application of some biotechnological concepts used in our daily life like biofuels, biofertilizers. An introduction to the origin of earth, the environment-air, water and land, origin of life on Earth, how life evolved from a single cell, some environmental problems and measures to be taken to combat them.

Course Contents:
Module I: Cell Biology
Organization of cell (Inorganic-Water and Ions; Organic-Proteins, Lipids and Carbohydrates constituents) Physical structure of the cell-Brief introduction to the Cell Membrane, Cytoplasm and its Organelles (Nucleus, Mitochondria, Golgi, Endoplasmic Reticulum, Lysosomes, Peroxisomes, Ribosomes, Chloroplasts)**,** Cell cycle.

Module II: Introduction to Cell Physiology
Transport of substances through the cell membrane- Osmosis, Diffusion and its types, Active transport (Sodium-potassium pump) and Passive transport, Membrane potential, Measuring Membrane Potential, Action Potential

Module III: Environmental Biotechnology
Biosensors, Biochips and Biofilms, GMO's and Biofertilizers
Biofuels
Gene Therapy, Stem cell and Nanobiomolecules
Bio Informatics- Introduction and Applications

Module IV: Ecology & Environment
Ecosystem- Structure and functions, Food chain, Food web, Energy flow, Ecological pyramids
Energy sources- Conventional (Coal, Petrol, Natural gas) and Non-conventional (Solar, Wind, Geothermal, Hydro and Biomass)
Pollution- Air, Water, Land, Thermal and Nuclear
Conferences and Protocols- Stockholm, Montreal, Rio-de-Janerio, Kyoto
Environmental issues- Green House Effect, Global Warming and Warning, El-Nino, Acid Rain,
Sustainable Development, Environmental Disasters (Earthquake, Floods, Drought and Cyclones)

Examination Scheme:

CELL BIOLOGY & GENETICS

Course Code: BTE2301 **Credit Units: 03**

Course Objective

Cell biology connects different fields of biotechnology by incorporating elements of biology, maths, physics and chemistry. The objective of the course is to understand the structure and function of ellular and sub cellular components of cells and tissues. It also focuses on the understanding of basic principles of genetics, incorporating the concepts of classical, molecular and population genetics. Compilation is required for recent advances in genetic principles for strong foundation in Biotechnology.

Course Contents

Module I

Cell theory, pre-cellular evolution, prokaryotic and eukaryotic cells. Cell cycle: molecular events, cell division, mitosis and meiosis.

Module II

Cellular organelles - structure and function of cell wall, plasma membrane nucleus, Mitochondria, Chloroplast, Nucleus, lysosomes, peroxisomes, golgi bodies, and transport across membranes. Cell locomotion- cytoskeleton, structure and function of cilia and flagella.

Module III

Cellular signaling –general mechanism of signaling and structures of the various types of receptors. Types of cancer, etiology of cancer, metastasis, cytological role of p53 and p21 genes in cancer development. Apoptosis.

Module IV

Genetics: classical and molecular genetics, Mendelian principles of inheritance, human genetics. Extension of Mendelism: Allelic variations, influence of environment on expression, penetrance and expressivity, epistasis, pleiotropy. Chromosomal basis of inheritance; linkage, crossing over and chromosome mapping.

Module V

Mutation and mutagenic agents, types of mutations. Numerical and structural changes in chromosomes with emphasis on human syndromes/plant breeding and genetic counseling. Economic importance of mutation

Module VI

Classical and modern concept of gene, pseudoallelism, position effect, intragenic crossing over & complementation (cistron, recon & nutron) Benzer's work on rII locus in T_2 bacteriophage. Genetics of Population: Hardy- Weinburg Law and its deviations.

BIOSTATISTICS

Course Code: BTE2303 **Credit Units: 03**

Course Objective:
The course aims to develop competency and expertise in the application of statistical methods applied to biological data obtained in experimental techniques, methodology and the safe laboratory practice.

Course Contents:

Module I
Statistics and Biostatistics: Preliminary concepts; Measures of Central Tendency: Mean, Median, Mode Measures of Dispersion: Range, Standard deviation, Variance

Module II: Probability
Random Experiments, Trial and Event, Sample Space, Mutually Exclusive or Disjoint Events, Mutually Exhaustive Events, Equally Probable Events, Complementary Event, Classical definition of Probability, Statistical definition of Probability, Axiomatic definition of Probability, Addition theorem, Multiplication theorem, Conditional Probability, Bayes' Theorem. Expectation.

Module III: Continuous Distribution
Normal Distribution, Properties of Normal distribution

Module IV: Correlation
Bivariate distribution Correlation, Types of Correlation, Simple Correlation Coefficient for ungrouped data, Properties and Interpretation of Correlation Coefficient, Coefficient of determination, Scatter diagram, Standard Error, Probable error of Correlation Coefficient. Rank correlation, Some examples.

Module V: Regression
Definition, Regression lines and Regression Coefficients, Properties of Regression Coefficients, Some examples. Method of least square: Fitting of straight line

Module VI: Introduction to the following Statistical terms
Parameter, Statistic, Null hypothesis, Alternative hypothesis, Critical region, Type1 Error, Type 11 Error, Level of significance, P-value and its applications.
Test of Significance for Small samples: One sample t-test, Paired t-test, Degrees of freedom for t-test, F test for equality of Population variances, Degrees of freedom for F-test.
Test of Significance for Large samples: Normal test for sample mean and population mean, Normal test for two sample means.
Chi-square Test: Test of goodness of fit, Test of Independence of attributes, Degrees of freedom for Chisquare test, Coefficient of contingency, Yates' correction for continuity.
Analysis of Variance: One way and Two way (only Examples)

DATABASE MANAGEMENT SYSTEM

Course Code: BTE2304 **Credit Units: 02**

Course Objective:
It enables the students to access biological information networks and databases in order to understand the different techniques of biotechnology to build detection systems especially in the prevention and treatment of human diseases.

Course Contents:

Module I: Overview and historical perspective
File systems vs. DBMS, advantages of DBMS

Module II: Describing and storing data in DBMS
Levels of abstraction and data independence; Data models and their comparison; Entity relationship model -concepts, design, keys and features; Relational model -introduction, structure of the relational databases, integrity constraints, Relational algebra and calculus -selection and projection, set operations, renaming, Joins, Division etc.

Module III: SQL and Perl

Module IV: Database design
Functional dependencies, Normal forms; Concurrency control and database discovery -concept of transaction: atomicity, consistency, isolation and durability, transactions and schedules, concurrent execution of transactions, Lock based concurrency control, Database recovery

Module V: Current trends
Distributed databases and multimedia databases;

Module VI: Data warehousing and Data Mining

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE

CELL BIOLOGY & GENETICS LAB

Course Code: BTE2307 **Credit Units: 02**

Course Contents

Module I
Microscopy: Light microscopy, Bright field, Phase contrast.

Module II
Study of chromoplasts, chloroplast in plant cell; Mitosis and Meiosis

Module III
Study of permanent slides of types of cancer; Study of apoptosis

Module IV
Study of gene interaction; chromosomal translocation in Rhoeo discolor

Module V
Study of bacterial conjugation and bacterial transduction

Module IV
Study of physical and chemical mutagens on growth of *E. coli*; PTC test

Examination Scheme:

DATABASE MANAGEMENT SYSTEMS LAB

Course Code: BTE2308 **Credit Units: 01**

Course Contents:

Module I
Database creation using DDL and DML.

Module II
Defining the primary and secondary keys.

Module III
Implementation of selection, projection and joins (internal and external) with SQL and Perl .

Module IV
Normalization of databases with SQL and Perl

Module V
Implementation of transactions and schedules.

Module VI
Detection of association rules and knowledge recovery.

INDUSTRIAL BIOTECHNOLOGY

Course Code: BTE2309 **Credit Units: 02**

Course Objective:
The objective of this course is to use microorganism to produce various compounds of commercial interest. The student will be exposed to various techniques available for large scale cultivation of microorganisms.

Course Contents:

Module I
Introduction to fermentation, the fermentation industry, Production process batch and Continuous system of cultivation, Solid-state fermentation

Module II
Selection of industrial microorganisms, media for fermentation, aeration, pH, temperature and other requirements during fermentation, downstream processing and product recovery, food industry waste as fermentation substrate.

Module III
Production of compounds like, antibiotics, enzymes, organic acids, solvents, beverages, SCP.

Module IV
Production of fermented dairy products

Module V
Immobilized enzymes systems, production and applications.

Examination Scheme:

FERMENTATION TECHNOLOGY

Course Code: BTE2310 **Credit Units: 02**

Objective of the course is for the acquaintance of large scale cultivation of microbes for production of industrially important products.

Course Contents

Module I: Fermentation Technology-An Overview
Development and overview of fermentation processes, strain development, media design and optimization, commercial media for fermentation

Module II: Bioproduct Production
Production of Organic acids: citric acid, acetic acid, lactic acid
Production of ethanol
Production of Antibiotics: penicillins, tetracyclins, chloramphenicol
Production of Recombinant products
Production of Industrial enzymes: cellulase, amylase, protease
Production of vitamins: B_{12}, riboflavin, fermented dairy products.

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

DRUG DESIGN AND DEVELOPMENT

Course Code: BTE2311 **Credit Units: 02**

Course Objective:
The above course will be aimed to identify and design drugs that could be potentially useful in the identification of the candidate drugs, which have efficacy in cell culture or animal models, and thus the most effective compounds could be employed based on the above results for being moved through preclinical studies to clinical trials.

Course Contents:

Module I: Drug targets classification
DNA, RNA, post-translational, processing enzymes, metabolic enzymes involved in nucleic acid synthesis, G-protein coupled receptors (monomeric transmembrane proteins), small molecule receptors, neuropeptide receptors, ion channels (monomeric multi-transmembrane) proteins, ligand-gated ion channels (oligomeric transmembrane proteins), transporters (multi-transmembrane proteins).

Module II: Target discovery and validation strategies
Genomics (new target discovery), biological activity directed and other types of screening, natural products, combinatorial chemistry; General overview of validation techniques.

Module III: Structure-based design
Drug design to discovery and development, drug metabolism, toxicity and pharmacokinetics, toxicology considerations, problems and drawbacks on drug discovery and development.
'de novo' design methodologies : indirect drug design, pharmacophore development and receptor mapping, combinatorial libraries and new strategies and recent technologies in drug design.

Module IV: Basic concepts of Drug Delivery
Introductory lecture (1-2), Concepts of Bio availability, Process of drug absorption, Pharmacokinetic processes, Timing for optimal therapy, Drug delivery considerations for the new biotherapeutics
Basic terminologies in drug delivery and drug targeting, Drug release, Drug targeting, Doses forms, Various routes of administration of drugs (just introduction), Strategies for enhanced therapeutic efficacies (Basic principles)

Module V: Delivery of Genetic material
Basic principles of gene expression, Viral and nonviral vectors in gene delivery, Clinical applications of gene therapy and antisense therapy
New generation technologies in Drug delivery and targeting
Nanotechnology / Nanobiotechnology, Use of biosensors and challenge of chronopharmacology, Microchips and controlled drug delivery, genetically engineered cell implants in drug deliver.

RECOMBINANT DNA TECHNOLOGY

Course Code: BTE2312 **Credit Units: 02**

Course Objective:
A complete understanding of molecular techniques like DNA sequencing, restriction mapping, PCR for the cloning and expression of genes can be obtained through the course.

Course Contents:

Module I
Purification of DNA from bacterial, plant and animal cells, manipulation of purified DNA.

Module II
Introduction of DNA into living cells

Module III
Introduction to gene cloning and its uses, tools and techniques: plasmids and other vectors, DNA, RNA, cDNA.

Module IV
Production of proteins from cloned genes: gene cloning in medicine (Pharmaceutical agents such as insulin, growth hormones, recombinant vaccines), gene therapy for genetic diseases.

Module V
Analysis of DNA by Southern blotting, Analysis of RNA by Northern blotting, Analysis of proteins by Western blot techniques, Dot blots and slot blots, RFLP, AFLP.
PCR: Basic principles and its modification application and uses.

TERM PAPER

Course Code: BTE2331 **Credit Units: 02**

METHODOLOGY

A term (or research) paper is primarily a record of intelligent reading in several sources on a particular subject.

The students will choose the topic at the beginning of the session in consultation with the faculty assigned. The progress of the paper will be monitored regularly by the faculty. At the end of the semester the detailed paper on the topic will be submitted to the faculty assigned. The evaluation will be done by Board of examiners comprising of the faculties.

GUIDELINES FOR TERM PAPER

The procedure for writing a term paper may consists of the following steps:

1. Choosing a subject
2. Finding sources of materials
3. Collecting the notes
4. Outlining the paper
5. Writing the first draft
6. Editing & preparing the final paper

1. Choosing a Subject

The subject chosen should not be too general.

2. Finding Sources of materials

a) The material sources should be not more than 10 years old unless the nature of the paper is such that it involves examining older writings from a historical point of view.
b) Begin by making a list of subject-headings under which you might expect the subject to be listed.
c) The sources could be books and magazines articles, news stories, periodicals, scientific journals etc.

3. Collecting the notes

Skim through sources, locating the useful material, then make good notes of it, including quotes and information for footnotes.

a) Get facts, not just opinions. Compare the facts with author's conclusion.
b) In research studies, notice the methods and procedures, results & conclusions.
c) Check cross references.

4. Outlining the paper

a) Review notes to find main sub-divisions of the subject.
b) Sort the collected material again under each main division to find sub-sections for outline so that it begins to look more coherent and takes on a definite structure. If it does not, try going back and sorting again for main divisions, to see if another general pattern is possible.

5. Writing the first draft

Write the paper around the outline, being sure that you indicate in the first part of the paper what its purpose is. You may follow the following:

a) statement of purpose
b) main body of the paper
c) statement of summary and conclusion

Avoid short, bumpy sentences and long straggling sentences with more than one main ideas.

6. Editing & Preparing the final Paper

a) Before writing a term paper, you should ensure you have a question which you attempt to answer in your paper. This question should be kept in mind throughout the paper. Include only information/ details/ analyses of relevance to the question at hand.

Sometimes, the relevance of a particular section may be clear to you but

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

not to your readers. To avoid this, ensure you briefly explain the relevance of every section.

b) Read the paper to ensure that the language is not awkward, and that it "flows" properly.
c) Check for proper spelling, phrasing and sentence construction.
d) Check for proper form on footnotes, quotes, and punctuation.
e) Check to see that quotations serve one of the following purposes:
   (i) Show evidence of what an author has said.
   (ii) Avoid misrepresentation through restatement.
   (iii) Save unnecessary writing when ideas have been well expressed by the original author.
f) Check for proper form on tables and graphs. Be certain that any table or graph is self-explanatory.

Term papers should be composed of the following sections:

1) Title page
2) Table of contents
3) Introduction
4) Review
5) Discussion & Conclusion
6) References
7) Appendix

Generally, the introduction, discussion, conclusion and bibliography part should account for a third of the paper and the review part should be two thirds of the paper.

Discussion

The discussion section either follows the results or may alternatively be integrated in the results section. The section should consist of a discussion of the results of the study focusing on the question posed in the research paper.

Conclusion

The conclusion is often thought of as the easiest part of the paper but should by no means be disregarded. There are a number of key components which should not be omitted. These include:

a) summary of question posed
b) summary of findings
c) summary of main limitations of the study at hand
d) details of possibilities for related future research

References

From the very beginning of a research project, you should be careful to note all details of articles gathered.

The bibliography should contain ALL references included in the paper. References not included in the text in any form should NOT be included in the bibliography.

The key to a good bibliography is consistency. Choose a particular convention and stick to this.

Bibliographical conventions

Monographs

Crystal, D. (2001), Language and the internet. Cambridge: Cambridge University Press.

Edited Volumes

Gass, S./Neu, J. (eds.) (1996), Speech acts across cultures. Challenges to communication in a second language. Berlin/ NY: Mouton de Gruyter.

[(eds.) is used when there is more than one editor; and (ed.) where there is only one editor. In German the abbreviation used is (Hrsg.) for Herausgeber].

Edited Articles

Schmidt, R./Shimura, A./Wang, Z./Jeong, H. (1996), Suggestions to buy: Television commercials from the U.S., Japan, China, and Korea. In: Gass, S./Neu, J. (eds.) (1996), Speech acts across cultures. Challenges to communication in a second language. Berlin/ NY: Mouton de Gruyter: 285-316.

PROJECT

Course Code: BTE2332 **Credit Units: 02**

Objectives:
The aim of the project is to provide the students with an opportunity to further their intellectual and personal development in the chosen field by undertaking a significant practical unit of activity. The project can be defined as a scholarly inquiry into a problem or issues, involving a systematic approach to gathering and analysis of information / data, leading to production of a structured report.

Chapter Scheme and distribution of marks:
Chapter 1: Introduction – 10 marks
Chapter 2: Conceptual Framework/ National/International Scenario – 25 marks
Chapter 3: Presentation, Analysis & Findings -- 25 marks
Chapter 4: Conclusion & Recommendations -- 10 marks
Chapter 5: Bibliography -- 05 marks

Project Report	Power Point Presentation & Viva
75 marks	25 marks

Components of a Project Report
The outcome of Project Work is the Project Report. A project report should have the following components:

1) Cover Page: This should contain the title of the project proposal, to whom it is submitted, for which degree, the name of the author, name of the supervisor, year of submission of the project work, name of the University.

2) Acknowledgement: Various organizations and individuals who might have provided assistance /co-operation during the process of carrying out the study.

3) Table of Content: Page-wise listing of the main contents in the report, i.e., different Chapters and its main Sections along with their page numbers.

4) **Body of the Report:** The body of the report should have these four logical divisions
a) ***Introduction:*** This will cover the background, rationale/ need / justification, brief review of literature, objectives, methodology (the area of the study, sample, type of study, tools for data collection, and method of analysis), Limitations of the Study, and Chapter Planning.
b) ***Conceptual Framework / National and International Scenario*****:** (relating to the topic of the Project).
c***) Presentation of Data, Analysis and Findings*****:** (using the tools and techniques mentioned in the methodology).
d) ***Conclusion and Recommendations:*** In this section, the concluding observations based on the main findings and suggestions are to be provided.

5) Bibliography or References: This section will include the list of books and articles which have been used in the project work, and in writing a project report.

6) Annexures: Questionnaires (if any), relevant reports, etc.
(The main text of the Project should normally be in the range of 5000 words. However, there may be annexure in addition to the main text)

The Steps of a Project Report

Step I : Selection of the topic for the project by taking following points into consideration:

- Suitability of the topic.
- Relevance of the topic

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

- Time available at the disposal.
- Feasibility of data collection within the given time limit.
- Challenges involved in the data collection (time & cost involved in the data collection, possibility of getting responses, etc.)

Step II : Finalisation of the Topic and preparation of Project Proposal in consultation with the Supervisor.

Step III : Collection of information and data relating to the topic and analysis of the same.

Step IV: Writing the report dividing it into suitable chapters, viz.,
Chapter 1: Introduction,
Chapter 2: Conceptual Framework / National & International Scenario,
Chapter 3: Analysis & Findings
Chapter 4: Conclusion and Recommendations.

Step V: The following documents are to be attached with the Final Project Report.
1) Approval letter from the supervisor (Annexure-IA)
2) Student's declaration (Annexure-IB)
3) Certificate from the Competent Authority of the Organisation / Institution, if the student undertakes the Project Work in any Organisation / Institution.

Guidelines for Evaluation:

- Each of the students has to undertake a Project individually under the supervision of a teacher and to submit the same following the guidelines stated below.
- Language of Project Report and Viva-Voce Examination may be English. The Project Report must be typed and hard bound.
- Failure to submit the Project Report or failure to appear at the Viva-voce Examination will be treated as "Absent" in the Examination. He /she has to submit the Project Report and appear at the Viva-Voce Examination in the subsequent years (within the time period as per University Rules).
- No marks will be allotted on the Project Report unless a candidate appears at the Viva-Voce Examination. Similarly, no marks will be allotted on Viva-Voce Examination unless a candidate submits his/her Project Report.
- Evaluation of the Project Work to be done jointly by one internal expert and one external expert with equal weightage, i.e., average marks of the internal and external experts will be allotted to the candidate.

WORKSHOP / CERTIFICATION

Course Code: BTE2333 **Credit Units: 02**

Objectives

A workshop is primarily an activity based academic event that is organized to provide the students a one to one and hands on experience on any aspect of their learning. The communication in a workshop has to be necessarily two way. The trainer has to make sure that the aspect covered are practically practiced by the participants. The student will choose the option of workshop from amongst their concentration electives. The evaluation will be done by Board of examiners comprising of the faculties.

Major Themes for Workshop

The workshop may be conducted on any of the following major themes:
Accounting
Finance
Human Resources
Marketing
Economics
Operations
Supply Chain Management
These themes are merely indicative and other recent and relevant topics of study may be included.

Guidelines for Workshop

The procedure for earning credits from workshop consists of the following steps:
Relevant study material and references will be provided by the trainer in advance.
The participants are expected to explore the topic in advance and take active part in the discussions held
Attending and Participating in all activities of the workshop
Group Activities have to be undertaken by students as guided by the trainer.
Evaluation of workshop activities would be done through test and quiz at the end of the workshop.
Submitting a write up of at least 500 words about the learning outcome from the workshop.

Methodology

The methodology followed at the workshop could be based on any one or more of the following methods:
Case Study
Business Game
Simulation
Group Activity
Role Play
Business Planning
Quiz

Evaluation Scheme:

Attendance	Active Participation	Multiple Choice Questions/ Quiz	Solving the case/ Assignment/ Write up	Total
10	30	30	30	100

MICROBIOLOGY

Course Code: BTE2401 **Credit Units: 03**

Course Objective:
The course imparts the knowledge of different types of microorganisms that are invisible to our naked eyes. Discovery origin and evaluation of different forms of bacteria, fungi, protozoa and viruses constitute the basics of biotechnology.

Course Contents:

Module I
Introduction and historical perspective - Discovery of the microbial world, controversy over spontaneous generation, role of microorganisms in transformation of organic matter and in the causation of diseases, development of pure culture methods. Methods in Microbiology -Principles of microbial nutrition, Culture media, Theory and practice of sterilization, pure culture techniques.

Module II
Prokaryotic structure and function - functional anatomy of bacteria: cell envelope, cell wall, cytoplasmic membrane, capsule, surface appendages, cytoplasm and cytoplasmic inclusions. Growth - The definition of growth, mathematical expression of growth, growth curve, measurement of growth, synchronous growth, continuous culture, culture collection and maintenance of cultures.

Module III
Systematics and taxonomy - new approaches to bacterial taxonomy, classification including ribotyping, ribosomal RNA sequencing, characteristics of primary domains, taxonomy, nomenclature and Bergey's manual.

Module IV
Metabolic Diversity among microorganisms - photosynthesis in microorganisms, role of bacteriochlorophylls, carotenoids and phycobilins, Chemolithotrophy, hydrogrn-iron-nitrite-oxidizing bacteria, nitrate and sulphate reduction, methanogenesis and acetogenesis, Fermentations, nitrogen fixation, plant microbe interactions (mycorrhizae).

Module V: Archaea
Archae as earliest life forms, thermophiles, psychrophiles, halophiles, alkalophiles, acidophiles, hyperthermophiles Viruses: Bacterial, animal; structure of viruses; Reproduction and life cycle of RNA and DNA viruses; Viroids and prions. Algae and Fungi: Classification and Reproduction.

Module VI
Host-parasite relationship - Normal micro flora of skin, oral cavity, gastrointestinal tract, Respiratory infections; entry of pathogens into the host, types of toxins (Exo, endo, entro) and their mode of actions, Microbial pathogenesis -Disease reservoirs; Epidemiological terminologies; Infectious disease transmission; Sexually transmitted disease including AIDS, Food and water- borne diseases; pathogenic fungi.

Module VII
Chemotherapy/antibiotics -Antimicrobial agents, sulfa drugs, antibiotics -penicillin and cephalosporins, broad spectrum antibiotics, antifungal antibiotics; mode of action.

ENZYMOLOGY AND ENZYME TECHNOLOGY

Course Code: BTE2403 **Credit Units: 03**

Course Objective:
The course aims to provide an understanding of the principles and application of proteins, secondary metabolites and enzyme biochemistry in therapeutic applications and clinical diagnosis. The theoretical understanding of biochemical systems would certainly help to interpret the results of laboratory experiments.

Course Contents:

Module I: Enzymes
Introduction and scope, Nomenclature, Mechanism of Catalysis.

Module II: Enzyme Kinetics
Single substrate steady state kinetics; Michaelis Menten equation, Linear plots, King-Altman's method; Inhibitors and activators; Multisubstrate systems; ping-pong mechanism, Alberty equation, Sigmoidal kinetics and Allosteric enzymes

Module III
Immobilization of Enzymes; Advantages, Carriers, adsorption, covalent coupling, cross-linking and entrapment methods, Micro-environmental effects.

Module IV: Enzyme reactors
Reactors for batch/continuous enzymatic processing, choice of reactor type; idealized enzyme reactor systems, Mass transfer in enzyme reactors: Steady state analysis of mass transfer and biochemical reaction in enzyme reaction.

Module V: Bioprocess Design
Physical parameters, reactor operational stability, Immobilized cells.

Module VI: Challenges and future trends
Enzyme catalysis in organic media; catalytic antibodies and non protein biomolecules as catalysts, biocatalysts from extreme thermophilic and hyper thermophilic Archae and Bacteria.

CHEMICAL ENGINEERING PRINCIPLES

Course Code: BTE2404 **Credit Units: 02**

Course Objective:
The knowledge gained through chemical reaction engineering and material and energy balances will help the students to understand the tools and techniques of biotechnology.

Course Contents:

Module I: Material and Energy Balances
Units and dimensions, Dimensional analysis; Simple problems on material balance calculations involving unit processes and reactive systems; Available electron balances.
Basic energy concepts -enthalpy changes in chemical/biochemical reactions and in non-reactive processes, Energy balance calculations, Use of Steam tables; Heat of reaction and energy balance for microbial processes.

Module II: Chemical reaction engineering
Kinetics of homogenous reactions: Concepts of reaction rate, order of reaction and molecularity, Analysis of batch reactors for kinetic interpretation of data and isothermal reactor design for single and multiple reactions, Design equations for CSTR and plug flow reactors.

Module III: Instrumentation and process control
Principles of measurement: error, accuracy and sensitivity; Measurement of flow, pressure, temperature, level, pH, viscosity and chemical composition.
Basic concepts of feedback control, control loop and its elements, Dynamic behaviour of first, second and higher order physical systems, controller hardware, choice of controllers and settings. Introduction to advanced control systems: feed forward, cascade and ratio control.

METHODS AND INSTRUMENTATION IN BIOTECHNOLOGY

Course Code: BTE2405 **Credit Units: 03**

Course Objective:
The students will be exposed to techniques and instruments that are used in biotech industries.

Course Contents:

Module I: Electrophoresis
Gel electrophoresis, SDS-PAGE, isoelectric focusing, two-dimensional electrophoresis, immuno electrophoresis, capillary electrophoresis

Module II: Chromatography
Paper, TLC, gel filtration, ion-exchange chromatography, affinity chromatography, HPLC and GLC

Module III: Spectroscopy
UV and visible spectroscopy, Infrared and Atomic absorption spectroscopy, fluorescence spectroscopy, Mass Spectrometry, MALDITOF, Nuclear Magnetic Resonance and Electron Spin Resonance spectroscopy,

Module IV
X-ray diffraction and X-ray Crystallography

MICROBIOLOGY LAB

Course Code: BTE2406 **Credit Units: 02**

Course Contents:

1. Preparation of solid and liquid media.
2. Isolation and maintenance of organisms by plating, streaking and serial dilution.
3. Preparation of slant cultures.
4. Growth curve measurement of bacterial population by turbidometry.
5. Measurement of bacterial population by dilution method.
6. Effect of temperature, pH, carbon and nitrogen sources on growth of bacteria.
7. Microscopic examination of bacteria by gram staining.
8. Endospore staining.
9. Capsule staining.
10. Isolation and identification of Rhizobium from root nodules.

ENZYMOLOGY AND ENZYME TECHNOLOGY LAB

Course Code: BTE2408 **Credit Units: 01**

Course Objective:
The laboratory will help the students to isolate enzymes from different sources, enzyme assays and studying their kinetic parameters which have immense importance in industrial processes.

Course Contents:

Module I
Isolation of enzymes from plant and microbial sources.

Module II
Enzyme assay; activity and specific activity – determination of amylase, nitrate reductase, cellulase, protease.

Module III
Purification of Enzyme by ammonium sulphate fractionation.

Module IV
Enzyme Kinetics: Effect of varying substrate concentration on enzyme activity, determination of Michaelis-Menten constant (K_m) and Maximum Velocity ($V_{max.}$) using Lineweaver-Burk plot.

Module V
Effect of Temperature and pH on enzyme activity.

Module VI
Enzyme immobilization

MARINE BIOTECHNOLOGY

Course Code: BTE2410 **Credit Units: 02**

Course Objective
The students will be exposed to basic concepts related to marine life. Also the subject deals with the scope and application of marine biota in biotechnology.

Course Contents

Module I
The marine ecosystem and its functioning: intertidal, estuarine, salt marsh, mangrove, coral reef, coastal & deep sea ecosystems. Marine viruses, Bacteria and their significance; Hydrothermal vents; Marine Biodiversity: defining, measurement and conservation strategies.

Module II
Nutrients cycling: carbon, nitrogen sulphur & phosphorus.
Global climate changes: impact on species diversity & productivity, oceans as a carbon sink, effects on corals bleaching. Biological rhythms.

Module III
Important Marine Products: Bioactive compounds from marine organisms, GFP, RFP characteristics and their applications; Green mussel adhesive protein, Chitosan and its applications

Module IV
Probiotic bacteria and their importance in aquaculture; Vaccines in aquaculture: Fish, shrimps & prawns; Marine food analysis-spoilage, quality control; Techniques for identification of bacterial & viral pathogens in aquaculture and Remedies.

VACCINE DEVELOPMENT

Course Code: BTE2411 **Credit Units: 02**

Course Objective
The students will be exposed to basic concepts related with development of vaccines.

Course Contents

Module I
History of Vaccine Development
Definition of Vaccine
Evolution of Vaccines

Module II
Process development for vaccines
Manufacturing of vaccines
Various aspects of vaccines, process development and manufacturing

Module III
Clinical development of vaccines
Clinical end-point: Evolution of vaccines
General specifications and pharmaceuticals release criteria for the existing vaccines
Cold chain management of vaccines
Current vaccine research

AGRICULTURAL BIOTECHNOLOGY

Course code: BTE2412 **Credit Units: 02**

Course Objective:
This course aims to facilitate the students to meet the following learning objectives.
By the end of this course the student should be able to:

- Describe the history of crop development over the centuries by natural processes, human selection and breeding
- Explain the role of mutagenesis-based plant breeding in green revolution, and the consequences of green revolution including its impacts on global health and environment
- Understand and clearly describe the science underlying molecular breeding and marker assisted selection
- Understand and clearly describe the science underlying genetic engineering and GM crops (with focus on Agrobacterium-mediated and particle-bombardment methods
- Be able to enumerate biological risks (health and environmental) of GM crops, and explain the principles & methodologies of risk assessment
- Examine the causes and effects of the public's concerns about GM technology
- Be aware of the regulatory and legal system to test and monitor release and use of GM crops.

Course Contents:
Module-I: History of crop improvement, and pre-genetic engineering plant biotechnology: Traditional breeding; Mutagenesis-based breeding; Role of tissue culture in crop improvement, Molecular breeding and marker assisted selection.

Module-II: Genetic engineering of plants: *Agrobacterium* mediated transformation; Particle bombardment mediated transformation; Limitations of conventional transgenics and solutions offered by gene targeting and gene editing technologies.

Module-III: GM crops and the society: Biological (Environmental and Health) risks of GM; Risk assessment; Concerns and fears about GM technology; Regulatory and Legal system to test and monitor GM crops

Examination Scheme:

NATURAL PRODUCTS AND MEDICINAL CHEMISTRY

Course Code: BTE2413 **Credit Units: 02**

Course Objective: The students will be exposed to basic concepts related with natural products and medicinal chemistry and its biological application.

Course Contents:

Natural Products

Module I
Introductory bio-organic chemistry: enzymatic transformations, co-factors, examples from carbohydrate chemistry.

Module II
Isoprenoids, Terpenes and Flavonoids: biosynthetic origins of the group, survey of classes, electron-deficient rearrangements, chemical synthesis, steroids; Alkaloids: shikimate pathway to aromatic amino acids, pyridoxyl phosphate mediated transformations in alkaloid biosynthesis

Medicinal Chemistry

Module III
Drug processing in mammals
The molecular basis of drug action
The multiphore conceptualization of drugs
Messenger and non-messenger target systems

Examination Scheme:

Components	H/S	A	CT	EE
Weightage (%)	10	5	15	70

STEM CELL TECHNOLOGY

Course Code: BTE2414 **Credit Units: 02**

Course Objective: The objective of this paper is to familiarize the students with stem cell technology and its applications for betterment of the society. The course is designed to give a broad view of mammalian stem cells, reviewing where they are found in the body, the different types and how they are cultured. The topics will cover the basic biology of these stem cells as well as bioengineering and application of these stem cells to potential treatments of human diseases.

Course Contents:

Module I
Definition, properties, proliferation, culture of stem cells, medical applications of stem cells, ethical and legal issues in use of stem cells.

Module II
Stem Cell biology and therapy, types embryonic stem cell, Adult stem cell, Stem Cell Biology and Therapy, Embryonic Stem Cells, culture and the potential benefits of stem cell technology

Module III
Gene Therapy: Introduction, History and evolution of Gene therapy, optimal disease targets, Failures and successes with gene therapy and future prospects,Genetic Perspectives for Gene Therapy, **Gene Delivery** methods: Viral vectors and Non-viral Vectors

Module IV
Regulatory and Ethical Considerations of stem cell and Gene Therapy, Assessing Human Stem Cell Safety, Use of Genetically Modified Stem Cells in Experimental Gene Therapies.

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

TERM PAPER

Course Code: BTE2431 **Credit Units: 02**

METHODOLOGY

A term (or research) paper is primarily a record of intelligent reading in several sources on a particular subject.

The students will choose the topic at the beginning of the session in consultation with the faculty assigned. The progress of the paper will be monitored regularly by the faculty. At the end of the semester the detailed paper on the topic will be submitted to the faculty assigned. The evaluation will be done by Board of examiners comprising of the faculties.

GUIDELINES FOR TERM PAPER

The procedure for writing a term paper may consists of the following steps:

- Choosing a subject
- Finding sources of materials
- Collecting the notes
- Outlining the paper
- Writing the first draft
- Editing & preparing the final paper

1. Choosing a Subject

The subject chosen should not be too general.

2. Finding Sources of materials

d) The material sources should be not more than 10 years old unless the nature of the paper is such that it involves examining older writings from a historical point of view.
e) Begin by making a list of subject-headings under which you might expect the subject to be listed.
f) The sources could be books and magazines articles, news stories, periodicals, scientific journals etc.

3. Collecting the notes

Skim through sources, locating the useful material, then make good notes of it, including quotes and information for footnotes.

d) Get facts, not just opinions. Compare the facts with author's conclusion.
e) In research studies, notice the methods and procedures, results & conclusions.
f) Check cross references.

4. Outlining the paper

c) Review notes to find main sub-divisions of the subject.
d) Sort the collected material again under each main division to find sub-sections for outline so that it begins to look more coherent and takes on a definite structure. If it does not, try going back and sorting again for main divisions, to see if another general pattern is possible.

5. Writing the first draft

Write the paper around the outline, being sure that you indicate in the first part of the paper what its purpose is. You may follow the following:

a) statement of purpose
b) main body of the paper
c) statement of summary and conclusion

Avoid short, bumpy sentences and long straggling sentences with more than one main ideas.

6. Editing & Preparing the final Paper

g) Before writing a term paper, you should ensure you have a question which you attempt to answer in your paper. This question should be kept

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

in mind throughout the paper. Include only information/ details/ analyses of relevance to the question at hand. Sometimes, the relevance of a particular section may be clear to you but not to your readers. To avoid this, ensure you briefly explain the relevance of every section.

h) Read the paper to ensure that the language is not awkward, and that it "flows" properly.
i) Check for proper spelling, phrasing and sentence construction.
j) Check for proper form on footnotes, quotes, and punctuation.
k) Check to see that quotations serve one of the following purposes:
   (iv) Show evidence of what an author has said.
   (v) Avoid misrepresentation through restatement.
   (vi) Save unnecessary writing when ideas have been well expressed by the original author.
l) Check for proper form on tables and graphs. Be certain that any table or graph is self-explanatory.

Term papers should be composed of the following sections:

- Title page
- Table of contents
- Introduction
- Review
- Discussion & Conclusion
- References
- Appendix

Generally, the introduction, discussion, conclusion and bibliography part should account for a third of the paper and the review part should be two thirds of the paper.

Discussion

The discussion section either follows the results or may alternatively be integrated in the results section. The section should consist of a discussion of the results of the study focusing on the question posed in the research paper.

Conclusion

The conclusion is often thought of as the easiest part of the paper but should by no means be disregarded. There are a number of key components which should not be omitted. These include:

e) summary of question posed
f) summary of findings
g) summary of main limitations of the study at hand
h) details of possibilities for related future research

References

From the very beginning of a research project, you should be careful to note all details of articles gathered.

The bibliography should contain ALL references included in the paper. References not included in the text in any form should NOT be included in the bibliography.

The key to a good bibliography is consistency. Choose a particular convention and stick to this.

Bibliographical conventions

PROJECT

Course Code: BTE2432 **Credit Units: 02**

Objectives:
The aim of the project is to provide the students with an opportunity to further their intellectual and personal development in the chosen field by undertaking a significant practical unit of activity. The project can be defined as a scholarly inquiry into a problem or issues, involving a systematic approach to gathering and analysis of information / data, leading to production of a structured report.

Chapter Scheme and distribution of marks:
Chapter 1: Introduction – 10 marks
Chapter 2: Conceptual Framework/ National/International Scenario – 25 marks
Chapter 3: Presentation, Analysis & Findings -- 25 marks
Chapter 4: Conclusion & Recommendations -- 10 marks
Chapter 5: Bibliography -- 05 marks

Project Report	Power Point Presentation & Viva
75 marks	25 marks

Components of a Project Report
The outcome of Project Work is the Project Report. A project report should have the following components:

1) Cover Page: This should contain the title of the project proposal, to whom it is submitted, for which degree, the name of the author, name of the supervisor, year of submission of the project work, name of the University.

2) Acknowledgement: Various organizations and individuals who might have provided assistance /co-operation during the process of carrying out the study.

3) Table of Content: Page-wise listing of the main contents in the report, i.e., different Chapters and its main Sections along with their page numbers.

4) **Body of the Report:** The body of the report should have these four logical divisions
a) ***Introduction:*** This will cover the background, rationale/ need / justification, brief review of literature, objectives, methodology (the area of the study, sample, type of study, tools for data collection, and method of analysis), Limitations of the Study, and Chapter Planning.
b) ***Conceptual Framework / National and International Scenario*****:** (relating to the topic of the Project).
c***) Presentation of Data, Analysis and Findings*****:** (using the tools and techniques mentioned in the methodology).
d) ***Conclusion and Recommendations:*** In this section, the concluding observations based on the main findings and suggestions are to be provided.

5) Bibliography or References: This section will include the list of books and articles which have been used in the project work, and in writing a project report.

6) Annexures: Questionnaires (if any), relevant reports, etc.
(The main text of the Project should normally be in the range of 5000 words. However, there may be annexure in addition to the main text)

The Steps of a Project Report

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Step I : Selection of the topic for the project by taking following points into consideration:

- Suitability of the topic.
- Relevance of the topic
- Time available at the disposal.
- Feasibility of data collection within the given time limit.
- Challenges involved in the data collection (time & cost involved in the data collection, possibility of getting responses, etc.)

Step II : Finalisation of the Topic and preparation of Project Proposal in consultation with the Supervisor.

Step III : Collection of information and data relating to the topic and analysis of the same.

Step IV : Writing the report dividing it into suitable chapters, viz.,
Chapter 1:Introduction,
Chapter 2: Conceptual Framework / National & International Scenario,
Chapter 3: Analysis & Findings
Chapter 4: Conclusion and Recommendations.

Step V : The following documents are to be attached with the Final Project Report.
1) Approval letter from the supervisor (Annexure-IA)
2) Student's declaration (Annexure-IB)
3) Certificate from the Competent Authority of the Organisation / Institution, if the student undertakes the Project Work in any Organisation / Institution.

Guidelines for Evaluation:

- Each of the students has to undertake a Project individually under the supervision of a teacher and to submit the same following the guidelines stated below.
- Language of Project Report and Viva-Voce Examination may be English. The Project Report must be typed and hard bound.
- Failure to submit the Project Report or failure to appear at the Viva-voce Examination will be treated as "Absent" in the Examination. He /she has to submit the Project Report and appear at the Viva-Voce Examination in the subsequent years (within the time period as per University Rules).
- No marks will be allotted on the Project Report unless a candidate appears at the Viva-Voce Examination. Similarly, no marks will be allotted on Viva-Voce Examination unless a candidate submits his/her Project Report.
- Evaluation of the Project Work to be done jointly by one internal expert and one external expert with equal weightage, i.e., average marks of the internal and external experts will be allotted to the candidate.

WORKSHOP / CERTIFICATION

Course Code: BTE2433 **Credit Units: 02**

Objectives

A workshop is primarily an activity based academic event that is organized to provide the students a one to one and hands on experience on any aspect of their learning. The communication in a workshop has to be necessarily two way. The trainer has to make sure that the aspect covered are practically practiced by the participants. The student will choose the option of workshop from amongst their concentration electives. The evaluation will be done by Board of examiners comprising of the faculties.

Major Themes for Workshop

The workshop may be conducted on any of the following major themes:
Accounting
Finance
Human Resources
Marketing
Economics
Operations
Supply Chain Management
These themes are merely indicative and other recent and relevant topics of study may be included.

Guidelines for Workshop

The procedure for earning credits from workshop consists of the following steps:
Relevant study material and references will be provided by the trainer in advance.
The participants are expected to explore the topic in advance and take active part in the discussions held
Attending and Participating in all activities of the workshop
Group Activities have to be undertaken by students as guided by the trainer.
Evaluation of workshop activities would be done through test and quiz at the end of the workshop.
Submitting a write up of at least 500 words about the learning outcome from the workshop.

Methodology

The methodology followed at the workshop could be based on any one or more of the following methods:
Case Study
Business Game
Simulation
Group Activity
Role Play
Business Planning
Quiz

Evaluation Scheme:

Attendance	Active Participation	Multiple Choice Questions/ Quiz	Solving the case/ Assignment/ Write up	Total
10	30	30	30	100

MOLECULAR BIOLOGY

Course Code: BTE2501 **Credit Units: 03**

Course Objective:
The aim is to extend understanding of the molecular mechanisms via which genetic information is stored, expressed and transmitted among generations.

Course Contents:

Module I: DNA Replication and repair
Mechanism of Prokaryotic and Eukaryotic DNA replication, Enzymes and accessory proteins involved in DNA replication, DNA repair Mechanism.

Module II: Transcription
Prokaryotic transcription, Eukaryotic transcription, RNA polymerase, General and specific transcription factors, Regulatory elements.

Module III: Modifications in RNA
5'-cap formation, transcription termination, 3 '-end processing and polyadenylation, Splicing, Editing, Nuclear export of mRNA and mRNA stability.

Module IV: Translation
Prokaryotic and Eukaryotic translation, the translation Machinery; Mechanisms of initiation, elongation and termination, regulation of translation, co-and post-translational modifications of proteins.

Module V: Regulation of Gene Expression in prokaryotic and eukaryotic systems
Lac operon, Ara operan, regulation in Eukaryotes

Module VI: Antisense and Ribozyme technology
Molecular mechanism of antisense molecules, inhibition of spilicing, polyadenylation and translation, disruption of RNA structure and capping, Biochemistry of Ribozyme; Hammerhead, hairpin and other ribozymes, strategies for designing ribozymes, applications of antisense and ribozyme technologies.

Examination Scheme:

BIOINFORMATICS

Course Code: BTE2504 **Credit Units: 03**

Course Objective:
The course involves a basic understanding of computer and bioinformatics tools and skills in the field of biology.

Course Contents:
Module I: Introduction and overview
The NCBI data model; sequence databases, sequence retrieval, sequence file formats, submitting DNA and protein sequences; classification of biological databases

Module II: Biological Databases
Sequence databases (EMBL, GenBank, DDBJ, -UNIPROT, PIR, TrEMBL), Protein family/domain databases (PROSITE, PRINTS, Pfam, BLOCK, etc), Cluster databases-An Introduction, Specialised databases (KEGG, etc), Database technologies (Flat-file), Structural databases (PDB)

Module III: Sequence alignment
Global and local alignments, statistical significance of alignments, scoring matrices and gap penalties, position specific scoring matrices, programs and methods for Pairwise and multiple alignment, pattern searching programs, family and superfamily representation - Pfam, hidden Markov models

Module IV: Phylogenetic prediction
Phylogenetic analysis, Evolutionary Models, Character and distance based Tree building methods; tree evaluation, phylogenetic analysis, parsimony, maximum likelihood trees; Trees-splits and metrices on trees, tree interpretation, Distance – additive, ultrameric and nonadditive distances.

Module V: Predictive methods using DNA and protein sequences
ESTs: construction, databases, clustering, gene discovery and identification, and functional classification. Protein identification tools, physical properties, motifs and patterns, structure, folding classes, structure classification databases – Scop and Cath;

Module VI: Structure databases
Structural databases - PDB and MMDB, structure file formats, Secondary and tertiary structure prediction methods in proteins, Internal and external co-ordinate system, software to visualize secondary and tertiary structural information in protein.

Module VII: Comparative genome analysis
Reconstruction of metabolic pathways; Genome analysis, genome anatomy, genome rearrangements with inversions, signed inversions, gene identification, gene expression, expression analysis, gene identification and functional classification.

SUMMER INTERNSHIP EVALUATION-I

Course Code: BTE2535 **Credit Units: 03**

GUIDELINES FOR PROJECT FILE

Research experience is as close to a professional problem-solving activity as anything in the curriculum. It provides exposure to research methodology and an opportunity to work closely with a faculty guide. It usually requires the use of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation.

Research is genuine exploration of the unknown that leads to new knowledge which often warrants publication. But whether or not the results of a research project are publishable, the project should be communicated in the form of a research report written by the student.

Sufficient time should be allowed for satisfactory completion of reports, taking into account that initial drafts should be critiqued by the faculty guide and corrected by the student at each stage.

The File is the principal means by which the work carried out will be assessed and therefore great care should be taken in its preparation.

Methodology

The students will be sent to various industries and institutes where they will undergo short term training. After the completion of the training the students will be required to submit project report which shall then be evaluated by two internal examiners. The students will then have to appear for a Viva Voce examination to be conducted by an external evaluator at the end of the semester.

In general, the File should be comprehensive and include

- A short account of the activities that were undertaken as part of the project;
- A statement about the extent to which the project has achieved its stated goals.
- A statement about the outcomes of the evaluation and dissemination processes engaged in as part of the project;
- Any activities planned but not yet completed as part of the project, or as a future initiative directly resulting from the project;
- Any problems that have arisen that may be useful to document for future reference.

Report Layout

The report should contain the following components:

- **Title or Cover Page**

The title page should contain the following information: Project Title; Student's Name; Course; Year; Supervisor's Name.

- **Acknowledgements** (optional)

Acknowledgment to any advisory or financial assistance received in the course of work may be given.

- **Abstract**

A good "Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard to the objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project

- **Table of Contents**

Titles and subtitles are to correspond exactly with those in the text.

- **Introduction**

Here a brief introduction to the problem that is central to the project and an outline of the

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided.

- **Materials and Methods**

This section should aim at experimental designs, materials used. Methodology should be mentioned in details including modifications if any.

- **Results and Discussion**

Present results, discuss and compare these with those from other workers, etc. In writing these section, emphasis should be given on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in text books. Avoid abrupt changes in contents from section to section and maintain a lucid flow throughout the thesis. An opening and closing paragraph in every chapter could be included to aid in smooth flow.

Note that in writing the various secions, all figures and tables should as far as possible be next to the associated text, in the same orientation as the main text, numbered, and given appropriate titles or captions. All major equations should also be numbered and unless it is really necessary never write in "point" form.

- **Conclusion**

A conclusion should be the final section in which the outcome of the work is mentioned briefly.

- **Future prospects**

- **Appendices**

The Appendix contains material which is of interest to the reader but not an integral part of the thesis and any problem that have arisen that may be useful to document for future reference.

- **References / Bibliography**

This should include papers and books referred to in the body of the report. These should be ordered alphabetically on the author's surname. The titles of journals preferably should not be abbreviated; if they are, abbreviations must comply with an internationally recognised system.

Examples

For research article

Voravuthikunchai SP, Lortheeranuwat A, Ninrprom T, Popaya W, Pongpaichit S, Supawita T. (2002) Antibacterial activity of Thai medicinal plants against enterohaemorrhagic *Escherichia coli* O157: H7. *Clin Microbiol Infec*, **8** (suppl 1): 116–117.

For book

Kowalski, M. (1976) Transduction of effectiveness in *Rhizobium meliloti*. SYMBIOTIC NITROGEN FIXATION PLANTS (editor P.S. Nutman IBP), **7**: 63-67

ASSESSMENT OF THE PROJECT FILE

Essentially, marking will be based on the following criteria: the quality of the report, the technical merit of the project and the project execution.

Technical merit attempts to assess the quality and depth of the intellectual efforts put into the project.

Project execution is concerned with assessing how much work has been put in.

The File should fulfill the following ***assessment objectives:***

Range of Research Methods used to obtain information

Execution of Research

Data Analysis

Analyse Quantitative/ Qualitative information

BIOFUEL AND GREEN TECHNOLOGY

Course Code: BTE2509 **Credit Units: 02**

Course Objective:
This course will acquaint the students with bioenergy resources, their properties, preparation, processing along with the details of equipments utilized for the purpose.

Course Contents:

Module I: Biomass Sources, Characteristics & Preparation: Biomass Sources and Classification
Chemical composition and properties of different biomass materials and bio-fuels – Sugar cane molasses for fermentation ethanol; Sources and processing of oils and fats for liquid fuels- Energy plantations - Preparation of woody biomass; Drying, Storage and Handling of Biomass.

Module II: Biogas Technology
Feedstock for biogas production, biodegradable organic matter, Operating parameters for biogas production, Dry and wet fermentation

Module III: Bio-Ethanol and Bio-Diesel Technology
Production of Fuel Ethanol by Fermentation of Sugars. Trans-esterification of Oils to Produce Bio-Diesel.

Module IV: Pyrolysis and Gasification of Biomass
Thermo-chemical conversion of ligno-cellulose biomass - Pyrolysis of biomass,Thermo-chemical gasification principles

Module V: Combustion of Biomass and Cogeneration Systems
Combustion of Woody Biomass, Cogeneration in Biomass Processing Industries. Use of biogases for cogeneration.

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

STEM CELLS AND TISSUE ENGINEERING

Course Code: BTE2510 **Credit Units: 02**

Course Objective:
The course is designed to give a broad view of mammalian stem cells, reviewing where they are found in the body, different types and how they are cultured. The topics will cover the basic biology of these stem cells as well as bioengineering and application of these stem cells to potential treatments of human diseases.

Course Contents:

Module I
Stem Cell biology; types; embryonic stem cell, Adult stem cell and potential benefits of stem cell technology, Bone marrow transplants, Immunotherapy, Autoimmune Diseases and Promise of Stem Cell-Based Therapies, Stem Cells and Diabetes, Stem Cells and heart Repair

Module II
Gene Therapy: Introduction, History and evolution of Gene therapy, optimal disease targets, Failures and successes of gene therapy and future prospects; Gene Therapy and Immune System: Genetic Immunization, Innate and Acquired Immune Response to Gene Therapy

Module III
Gene Delivery methods; Viral vectors: Adenoviral, Adeno-associated virus (AAV), Retroviral, Lentiviral, Herpes Virus; Non-viral Vectors and Physical Methods & Combinatorial methods. Genetic perspectives for Gene Therapy, Gene Therapy for Cancer and Vascular Disorders, Nervous System.

Module IV
Regulatory and Ethical Considerations of Cell and Gene Therapy, Assessing Human Stem Cell Safety, Use of Genetically Modified Stem Cells in Experimental Gene Therapies.

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

JAVA-I

Course Code: BTE2511 **Credit Units: 02**

Course Objective:
The objective is to introduce students to a modern programming language and help them gain sufficient fluency to undertake research projects with a programming component; to lay the foundations for more advanced study of object-oriented languages
Emphasis is on to understand the basic concepts of programming; to learn the syntax and semantics of Java; to be able to use a program development environment

Course Contents:

Module I
Introduction to Java - Features, Inheritance, Strings, Packages, Interfaces; Multi- Threading, Applet Programming: AWT- Components, Menus, Layout manager, etc., Event Handling,, Java Packages - java.util, -java.io; exception handling,

Module II
Collection API - Arrays, Collection Interfaces, Concrete Collections, The Collections Framework, Legacy Collections

Module III
Swing

Module IV
- JDBC
- Introduction to Client Server Application
- Java Drivers
- java.sql Package
- Installing and setting up JDBC
- Basic JDBC Programming concepts
- Populating a database
- Executing Queries
- Scrollable and Updateable Result Sets

TERM PAPER

Course Code: BTE2531 **Credit Units: 02**

METHODOLOGY

A term (or research) paper is primarily a record of intelligent reading in several sources on a particular subject.

The students will choose the topic at the beginning of the session in consultation with the faculty assigned. The progress of the paper will be monitored regularly by the faculty. At the end of the semester the detailed paper on the topic will be submitted to the faculty assigned. The evaluation will be done by Board of examiners comprising of the faculties.

GUIDELINES FOR TERM PAPER

The procedure for writing a term paper may consists of the following steps:

- Choosing a subject
- Finding sources of materials
- Collecting the notes
- Outlining the paper
- Writing the first draft
- Editing & preparing the final paper

1. Choosing a Subject

The subject chosen should not be too general.

2. Finding Sources of materials

g) The material sources should be not more than 10 years old unless the nature of the paper is such that it involves examining older writings from a historical point of view.
h) Begin by making a list of subject-headings under which you might expect the subject to be listed.
i) The sources could be books and magazines articles, news stories, periodicals, scientific journals etc.

3. Collecting the notes

Skim through sources, locating the useful material, then make good notes of it, including quotes and information for footnotes.

g) Get facts, not just opinions. Compare the facts with author's conclusion.
h) In research studies, notice the methods and procedures, results & conclusions.
i) Check cross references.

4. Outlining the paper

e) Review notes to find main sub-divisions of the subject.
f) Sort the collected material again under each main division to find sub-sections for outline so that it begins to look more coherent and takes on a definite structure. If it does not, try going back and sorting again for main divisions, to see if another general pattern is possible.

5. Writing the first draft

Write the paper around the outline, being sure that you indicate in the first part of the paper what its purpose is. You may follow the following:

a) statement of purpose
b) main body of the paper
c) statement of summary and conclusion

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Avoid short, bumpy sentences and long straggling sentences with more than one main ideas.

6. Editing & Preparing the final Paper

m) Before writing a term paper, you should ensure you have a question which you attempt to answer in your paper. This question should be kept in mind throughout the paper. Include only information/ details/ analyses of relevance to the question at hand. Sometimes, the relevance of a particular section may be clear to you but not to your readers. To avoid this, ensure you briefly explain the relevance of every section.
n) Read the paper to ensure that the language is not awkward, and that it "flows" properly.
o) Check for proper spelling, phrasing and sentence construction.
p) Check for proper form on footnotes, quotes, and punctuation.
q) Check to see that quotations serve one of the following purposes:
   (vii) Show evidence of what an author has said.
   (viii) Avoid misrepresentation through restatement.
   (ix) Save unnecessary writing when ideas have been well expressed by the original author.
r) Check for proper form on tables and graphs. Be certain that any table or graph is self-explanatory.

Term papers should be composed of the following sections:

- Title page
- Table of contents
- Introduction
- Review
- Discussion & Conclusion
- References
- Appendix

Generally, the introduction, discussion, conclusion and bibliography part should account for a third of the paper and the review part should be two thirds of the paper.

Discussion

The discussion section either follows the results or may alternatively be integrated in the results section. The section should consist of a discussion of the results of the study focusing on the question posed in the research paper.

Conclusion

The conclusion is often thought of as the easiest part of the paper but should by no means be disregarded. There are a number of key components which should not be omitted. These include:

i) summary of question posed
j) summary of findings
k) summary of main limitations of the study at hand
l) details of possibilities for related future research

References

From the very beginning of a research project, you should be careful to note all details of articles gathered.

The bibliography should contain ALL references included in the paper. References not included in the text in any form should NOT be included in the bibliography.

The key to a good bibliography is consistency. Choose a particular convention and stick to this.

Bibliographical conventions

PROJECT

Course Code: BTE2532 **Credit Units: 02**

Objectives:
The aim of the project is to provide the students with an opportunity to further their intellectual and personal development in the chosen field by undertaking a significant practical unit of activity. The project can be defined as a scholarly inquiry into a problem or issues, involving a systematic approach to gathering and analysis of information / data, leading to production of a structured report.

Chapter Scheme and distribution of marks:
Chapter 1: Introduction – 10 marks
Chapter 2: Conceptual Framework/ National/International Scenario – 25 marks
Chapter 3: Presentation, Analysis & Findings -- 25 marks
Chapter 4: Conclusion & Recommendations -- 10 marks
Chapter 5: Bibliography -- 05 marks

Project Report	Power Point Presentation & Viva
75 marks	25 marks

Components of a Project Report
The outcome of Project Work is the Project Report. A project report should have the following components:

1) Cover Page: This should contain the title of the project proposal, to whom it is submitted, for which degree, the name of the author, name of the supervisor, year of submission of the project work, name of the University.

2) Acknowledgement: Various organizations and individuals who might have provided assistance /co-operation during the process of carrying out the study.

3) Table of Content: Page-wise listing of the main contents in the report, i.e., different Chapters and its main Sections along with their page numbers.

4) **Body of the Report:** The body of the report should have these four logical divisions
a) ***Introduction:*** This will cover the background, rationale/ need / justification, brief review of literature, objectives, methodology (the area of the study, sample, type of study, tools for data collection, and method of analysis), Limitations of the Study, and Chapter Planning.
b) ***Conceptual Framework / National and International Scenario*****:** (relating to the topic of the Project).
c***) Presentation of Data, Analysis and Findings*****:** (using the tools and techniques mentioned in the methodology).
d) ***Conclusion and Recommendations:*** In this section, the concluding observations based on the main findings and suggestions are to be provided.

5) Bibliography or References: This section will include the list of books and articles which have been used in the project work, and in writing a project report.

6) Annexures: Questionnaires (if any), relevant reports, etc.

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

(The main text of the Project should normally be in the range of 5000 words. However, there may be annexure in addition to the main text)

The Steps of a Project Report

Step I : Selection of the topic for the project by taking following points into consideration:

- Suitability of the topic.
- Relevance of the topic
- Time available at the disposal.
- Feasibility of data collection within the given time limit.
- Challenges involved in the data collection (time & cost involved in the data collection, possibility of getting responses, etc.)

Step II : Finalisation of the Topic and preparation of Project Proposal in consultation with the Supervisor.

Step III : Collection of information and data relating to the topic and analysis of the same.

Step IV : Writing the report dividing it into suitable chapters, viz.,
Chapter 1:Introduction,
Chapter 2: Conceptual Framework / National & International Scenario,
Chapter 3: Analysis & Findings
Chapter 4: Conclusion and Recommendations.

Step V : The following documents are to be attached with the Final Project Report.
1) Approval letter from the supervisor (Annexure-IA)
2) Student's declaration (Annexure-IB)
3) Certificate from the Competent Authority of the Organisation / Institution, if the student undertakes the Project Work in any Organisation / Institution.

Guidelines for Evaluation:

- Each of the students has to undertake a Project individually under the supervision of a teacher and to submit the same following the guidelines stated below.
- Language of Project Report and Viva-Voce Examination may be English. The Project Report must be typed and hard bound.
- Failure to submit the Project Report or failure to appear at the Viva-voce Examination will be treated as "Absent" in the Examination. He /she has to submit the Project Report and appear at the Viva-Voce Examination in the subsequent years (within the time period as per University Rules).
- No marks will be allotted on the Project Report unless a candidate appears at the Viva-Voce Examination. Similarly, no marks will be allotted on Viva-Voce Examination unless a candidate submits his/her Project Report.
- Evaluation of the Project Work to be done jointly by one internal expert and one external expert with equal weightage, i.e., average marks of the internal and external experts will be allotted to the candidate.

WORKSHOP / CERTIFICATION

Course Code: BTE2533 **Credit Units: 02**

Objectives

A workshop is primarily an activity based academic event that is organized to provide the students a one to one and hands on experience on any aspect of their learning. The communication in a workshop has to be necessarily two way. The trainer has to make sure that the aspect covered are practically practiced by the participants. The student will choose the option of workshop from amongst their concentration electives. The evaluation will be done by Board of examiners comprising of the faculties.

Major Themes for Workshop

The workshop may be conducted on any of the following major themes:
Accounting
Finance
Human Resources
Marketing
Economics
Operations
Supply Chain Management
These themes are merely indicative and other recent and relevant topics of study may be included.

Guidelines for Workshop

The procedure for earning credits from workshop consists of the following steps:
Relevant study material and references will be provided by the trainer in advance.
The participants are expected to explore the topic in advance and take active part in the discussions held
Attending and Participating in all activities of the workshop
Group Activities have to be undertaken by students as guided by the trainer.
Evaluation of workshop activities would be done through test and quiz at the end of the workshop.
Submitting a write up of at least 500 words about the learning outcome from the workshop.

Methodology

The methodology followed at the workshop could be based on any one or more of the following methods:
Case Study
Business Game
Simulation
Group Activity
Role Play
Business Planning
Quiz

Evaluation Scheme:

Attendance	Active Participation	Multiple Choice Questions/ Quiz	Solving the case/ Assignment/ Write up	Total

RECOMBINANT DNA TECHNOLOGY

Course Code: BTE2601 **Credit Units: 03**

Course Objective:
A complete understanding of molecular techniques can be obtained through the course. The successful application of biotechnology largely depends on these advanced molecular techniques.

Course Contents:
Module I: Enzymes used in RDT
Restriction endonuclease, methyltransferase, ligase, polymerase, kinase, phosphatase, nuclease, transferase, reverse transcriptase.

Module II: Cloning vectors
Plasmids, bacteriophages (Lambda and M13), phagemids, cosmids, artificial chromosomes (YAC, BAC). expression vectors (Bacteria and yeast), vector engineering (fusion tags, antibiotic markers), codon optimization, host engineering

Module III: Blotting techniques and hybridization
Southern, Northern and Western blotting techniques. Radioactive and non-radioactive probes.

Module IV: Nucleic acid amplification and its applications
Principles of PCR, designing of primers

Module V: Cloning Techniques
Basic cloning experiment: Design of cloning strategy and stepwise experimental procedure, Complementation, colony and plaque hybridization, restriction, PCR, plus-minus screening, immunoscreening.

Module VI: DNA Libraries
Purpose of constructing DNA libraries. Construction of cDNA and genomic libraries.

Module VII: Sequencing of DNA
DNA sequencing (Maxam Gilbert, Sanger's and automated), protein engineering.

Examination Scheme:

BIOPROCESS TECHNOLOGY

Course Code: BTE2602 **Credit Units: 03**

Course Objective:
The objective of the course is to apply the principles of biochemical engineering in large scale cultivation of microorganism for production of important products.

Course Contents:

Module I
Advantage of bioprocess over chemical process. Basic principle in bioprocess technology. Media formulation, Cell culture techniques; Inoculum development and aseptic transfers. Different types of pumps, valves, and line materials, piping conventions etc. used in Biochemical Process

Module II
Process technology for the production of primary metabolites, eg. biomass, ethanol, acetone-butanol, citric acid, amino acids, polysaccharides and plastics.

Ethanol: production by batch, continuous and cell recycle adopted by various technologies practiced in Indian distilleries using molasses and grains. Computation of fermentation efficiency, distillation efficiency and overall efficiency of ethanol production, recovery, uses, glucose effect etc. Power alcohol – definition, uses, merits and demerits of various technologies for its production.

Amino Acid: Genetic Control of metabolic pathway.
Lysine: Indirect and direct fermentation – mechanism of ph of metabolic block in accumulation of L-lysine by inhibition and repression mechanism.

Biomass: Bakers and distillers yeast production using various raw materials, "bios" factors for growth, Crabtree effect, harvesting, different forms and uses.
What are mushroom, different forms of common mushroom production from agro based raw materials and uses. Biofertilizers, biocompost and biopesticides

Module III
Production of secondary metabolites – penicillin, cephalosporins, streptomycin, tetracycline etc. Metabolites from plant and animal cell culture
Penicillin: Classification, various penicillin as precursor and 'R' – side chain, penicillinase, 6-APA, penicillin production, harvest and recovery, uses of various forms etc.
Streptomycin: chemical structure, production, harvest and recovery, use by-product of streptomycin fermentation etc.
Tetracycline: chemical structure, production, harvest and recovery, use by-product of tetracycline fermentation etc.

Module IV
Microbial production of industrial enzymes – glucose isomerase, penicillin acylase, cellulase, amylase, lipase, protease etc.

IMMUNOLOGY AND IMMUNOTECHNOLOGY

Course Code: BTE2603 **Credit Units: 03**

Course Objective:
Role of antibody engineering in biomedical applications and the importance of immuno genetics in disease processes, tissue transplantation and immune regulation are some of the areas of attributes of this course which can help the students to understand the biotechnology related to human kind.

Course Contents:

Module I: Introduction
Phylogeny of Immune System, Innate and acquired immunity, clonal nature of Immune Response.
Organization and structure of lymphoid organs Nature and Biology of antigens and super antigens Antibody structure and function; Types of immunity- innate, acquired, active and passive.

Module II: Major Histocompatibilty
MHC, BCR and TCR, generation of antibody diversity, Complement system

Module III: Cells of the immune system
Hematopoiesis and differentiation, lymphocyte trafficking, B-Lymphocytes, T -Lymphocytes, macrophages, dendritic cells, natural killer, lymphokines and lymphokine activated killer cells, eosinophils, neutrophils and mast cells

Module IV: Regulation of immune response
Antigen processing and presentation, activation of B and T lymphocytes, cytokines and their role in immune regulation, T cell regulation and MHC restriction, immunological tolerance

Module V: Cell mediated toxicity
Mechanism of T cell and NK cell mediated lysis and macrophage mediated cytotoxicity.

Module VI: Hypersensitivity

Module VII: Autoimmunity

Module VIII: Tumor immunology, Immunity to infectious agents

Module IX: Transplantation Immunology

Module X: Synthetic vaccines
Vaccines: General consideration, ideotype network hypothesis, Synthetic vaccines

Module XI: Hnmunological Techniques
Immuno diffusion, immuno-electrophoresis, ELISA, RIA, fluorescence activated cell sorter

Module XII: Hybridoma technology and its applications
Fusion of myeloma cells with lymphocytes

FUNDAMENTALS OF BIOCHEMICAL ENGINEERING

Course Code: BTE2604 **Credit Units: 02**

Course Objective:
The course material on the kinetics of microbial growth, substrate utilization and product formation etc. may help the students to understand the various principles involved in instrumentation and control of bioprocess.

Course Contents:

Module I
Kinetics of microbial growth, substrate utilization and product formation.

Module II
Sterilization of air and medium.

Module III
Batch, continuous, cell recycle and fed batch reactors; mass and energy balance in microbial processes, Bioreactor design, Different types of bioreactors, their parts and functions. Different types of valves.

Module IV
Mass transfer in Biological reactions; Scale-up principles; Instrumentation and control of bioprocesses.

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

RECOMBINANT DNA TECHNOLOGY LAB

Course Code: BTE2605 **Credit Units: 02**

Course Objective:
The laboratory experiments in Recombinant DNA Technology would certainly help to comprehend the theoretical aspects of the subject.

Course Contents:

Module I
Study of cloning (GFP CLONING)

Module II
Study of PCR

Module III
Study of Southern hybridiosation

Module IV
Study of RAPD

Module V
Site directed mutagenesis

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**
15	10	05	35	15	10	10

BIOPROCESS TECHNOLOGY LAB

Course Code: BTE2606 **Credit Units: 02**

Course Contents:

Module I
Isolation of industrially important micro organisms for microbial processes.

Module II
Determination of Thermal Death Point and Thermal death time of micro organisms for design of a sterilizer

Module III
Determination of growth curve of a supplied micro organism and also determine substrate degradation profile and to compute specific growth rate and growth yield from the data obtained.

Module IV
Comparative studies of ethanol production using different substrates.

Module V
Production of single cell protein

Module VI
Production and estimation of alkaline protease

Module VII
Sauer Krant fermentation

Module VIII
Use of alginate for cell immobilization

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

IMMUNOLOGY AND IMMUNOTECHNOLOGY LAB

Course Code: BTE2607 **Credit Units: 01**

Course Contents:

Module I
Blood film preparation and identification of cells.

Module II
Identification of blood group.

Module III
Isolation of serum.

Module IV
Lymphoid organs and their microscopic organization.

Module V
WIDAL Test

Module VI
Radial Immuno Diffusion Test

Module VII
Ouchterlony Double diffusion Test

Module VIII: Elisa
DOT, SANDWICH

Module IX
Purification of lgG through affinity chromatography

Module X
Immunohistochemistry

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

PHARMACEUTICAL BIOTECHNOLOGY

Course Code: BTE2608 **Credit Units: 02**

Course Objective:
The main objectives are to cover representative pharmaceutical dosage forms, and general issues of formulation, production, quality requirements, validation and uses and to gain an understanding of the challenges associated with quality pharmaceutical manufacturing

Course Contents:

Module I
Introduction to Physical Pharmaceutics - Metrology and Calculations,

Module II
Molecular structure, properties and States of Matter, Solutions, Phase Equilibra, Micromeritic and Powder Rheology, Surface and Interfacial Phenomena, Dispersion Systems, Diffusion & Dissolution, Kinetics and
drug stability, Viscosity & Rheology

Module III
Polymer Science and Applications, Formulations and Development, Packaging

Module IV
Introduction to Industrial Processing, Transport Phenomena (Fluid Flow, Heat Transfer and Mass Transfer)

Module V
Particulate Technology (Particle Size, Size reduction, Size Separation, Powder Flow and Compaction), Unit Operations (Mixing, Evaporation, Filtration, Centrifugation, Extraction, Distillation, and Drying)

Module VI
Materials of Pharmaceutical Plant Construction, Good Manufacturing Practice (GMP's) Guidelines

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

JAVA-II

Course Code: BTE2611 **Credit Units: 02**

Course Objective

The objective is to introduce students to a serverside programming language and help them gain sufficient fluency to undertake research projects with a programming component; to lay the foundations for study of web technologies and different tools used for the same.

Emphasis is on to understand the basic concepts of web programming; to learn the syntax and semantics of Servlet and JSP; to be able to use a server side program development environment

Course Contents

Module I

HTML and JavaScript, Creating and processing HTML forms

Module II

Java Servlets
Introduction to Server Side Application Development
Basics of Servlet Programming
Web Container
Session Tracking
Servlet Context

Module III: JSP

Advantage of JSP technology (Comparision with ASP / Servlet)
JSP Architecture, JSP Access Model
JSP Syntax Basic (Directions, Declarations, Expression, Scriplets, Comments)
JSP Implicit Object, Object Scope
Synchronization Issue
Exception Handling
Session Management

Module IV: Java Network Programming

Connecting to a server
Implementing Servers in Java
URL Connections
Reading and Posting data
Security and the Network
Java Beans

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

TERM PAPER

Course Code: BTE2631 **Credit Units: 02**

METHODOLOGY

A term (or research) paper is primarily a record of intelligent reading in several sources on a particular subject.

The students will choose the topic at the beginning of the session in consultation with the faculty assigned. The progress of the paper will be monitored regularly by the faculty. At the end of the semester the detailed paper on the topic will be submitted to the faculty assigned. The evaluation will be done by Board of examiners comprising of the faculties.

GUIDELINES FOR TERM PAPER

The procedure for writing a term paper may consists of the following steps:

- Choosing a subject
- Finding sources of materials
- Collecting the notes
- Outlining the paper
- Writing the first draft
- Editing & preparing the final paper

1. Choosing a Subject

The subject chosen should not be too general.

2. Finding Sources of materials

j) The material sources should be not more than 10 years old unless the nature of the paper is such that it involves examining older writings from a historical point of view.

k) Begin by making a list of subject-headings under which you might expect the subject to be listed.

l) The sources could be books and magazines articles, news stories, periodicals, scientific journals etc.

3. Collecting the notes

Skim through sources, locating the useful material, then make good notes of it, including quotes and information for footnotes.

j) Get facts, not just opinions. Compare the facts with author's conclusion.

k) In research studies, notice the methods and procedures, results & conclusions.

l) Check cross references.

4. Outlining the paper

g) Review notes to find main sub-divisions of the subject.

h) Sort the collected material again under each main division to find sub-sections for outline so that it begins to look more coherent and takes on a definite structure. If it does not, try going back and sorting again for main divisions, to see if another general pattern is possible.

5. Writing the first draft

Write the paper around the outline, being sure that you indicate in the first part of the paper what its purpose is. You may follow the following:

a) statement of purpose

b) main body of the paper

c) statement of summary and conclusion

Avoid short, bumpy sentences and long straggling sentences with more than one main ideas.

6. Editing & Preparing the final Paper

s) Before writing a term paper, you should ensure you have a question which you attempt to answer in your paper. This question should be kept in mind throughout the paper. Include only information/ details/ analyses of relevance to the question at hand.

Sometimes, the relevance of a particular section may be clear to you but

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

not to your readers. To avoid this, ensure you briefly explain the relevance of every section.

t) Read the paper to ensure that the language is not awkward, and that it "flows" properly.
u) Check for proper spelling, phrasing and sentence construction.
v) Check for proper form on footnotes, quotes, and punctuation.
w) Check to see that quotations serve one of the following purposes:
   (x) Show evidence of what an author has said.
   (xi) Avoid misrepresentation through restatement.
   (xii) Save unnecessary writing when ideas have been well expressed by the original author.
x) Check for proper form on tables and graphs. Be certain that any table or graph is self-explanatory.

Term papers should be composed of the following sections:

- Title page
- Table of contents
- Introduction
- Review
- Discussion & Conclusion
- References
- Appendix

Generally, the introduction, discussion, conclusion and bibliography part should account for a third of the paper and the review part should be two thirds of the paper.

Discussion

The discussion section either follows the results or may alternatively be integrated in the results section. The section should consist of a discussion of the results of the study focusing on the question posed in the research paper.

Conclusion

The conclusion is often thought of as the easiest part of the paper but should by no means be disregarded. There are a number of key components which should not be omitted. These include:

m) summary of question posed
n) summary of findings
o) summary of main limitations of the study at hand
p) details of possibilities for related future research

References

From the very beginning of a research project, you should be careful to note all details of articles gathered.

The bibliography should contain ALL references included in the paper. References not included in the text in any form should NOT be included in the bibliography.

The key to a good bibliography is consistency. Choose a particular convention and stick to this.

Bibliographical conventions

Monographs

Crystal, D. (2001), Language and the internet. Cambridge: Cambridge University Press.

Edited Volumes

Gass, S./Neu, J. (eds.) (1996), Speech acts across cultures. Challenges to communication in a second language. Berlin/ NY: Mouton de Gruyter.

[(eds.) is used when there is more than one editor; and (ed.) where there is only one editor. In German the abbreviation used is (Hrsg.) for Herausgeber].

Edited Articles

PROJECT

Course Code: BTE2632 **Credit Units: 02**

Objectives:
The aim of the project is to provide the students with an opportunity to further their intellectual and personal development in the chosen field by undertaking a significant practical unit of activity. The project can be defined as a scholarly inquiry into a problem or issues, involving a systematic approach to gathering and analysis of information / data, leading to production of a structured report.

Chapter Scheme and distribution of marks:
Chapter 1: Introduction – 10 marks
Chapter 2: Conceptual Framework/ National/International Scenario – 25 marks
Chapter 3: Presentation, Analysis & Findings -- 25 marks
Chapter 4: Conclusion & Recommendations -- 10 marks
Chapter 5: Bibliography -- 05 marks

Project Report	Power Point Presentation & Viva
75 marks	25 marks

Components of a Project Report
The outcome of Project Work is the Project Report. A project report should have the following components:

1) Cover Page: This should contain the title of the project proposal, to whom it is submitted, for which degree, the name of the author, name of the supervisor, year of submission of the project work, name of the University.

2) Acknowledgement: Various organizations and individuals who might have provided assistance /co-operation during the process of carrying out the study.

3) Table of Content: Page-wise listing of the main contents in the report, i.e., different Chapters and its main Sections along with their page numbers.

4) **Body of the Report:** The body of the report should have these four logical divisions
a) ***Introduction:*** This will cover the background, rationale/ need / justification, brief review of literature, objectives, methodology (the area of the study, sample, type of study, tools for data collection, and method of analysis), Limitations of the Study, and Chapter Planning.
b) ***Conceptual Framework / National and International Scenario*****:** (relating to the topic of the Project).
c***) Presentation of Data, Analysis and Findings*****:** (using the tools and techniques mentioned in the methodology).
d) ***Conclusion and Recommendations:*** In this section, the concluding observations based on the main findings and suggestions are to be provided.

5) Bibliography or References: This section will include the list of books and articles which have been used in the project work, and in writing a project report.

6) Annexures: Questionnaires (if any), relevant reports, etc.
(The main text of the Project should normally be in the range of 5000 words. However, there may be annexure in addition to the main text)

The Steps of a Project Report

Step I : Selection of the topic for the project by taking following points into consideration:

- Suitability of the topic.
- Relevance of the topic

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

- Time available at the disposal.
- Feasibility of data collection within the given time limit.
- Challenges involved in the data collection (time & cost involved in the data collection, possibility of getting responses, etc.)

Step II : Finalisation of the Topic and preparation of Project Proposal in consultation with the Supervisor.

Step III : Collection of information and data relating to the topic and analysis of the same.

Step IV : Writing the report dividing it into suitable chapters, viz.,
Chapter 1:Introduction,
Chapter 2: Conceptual Framework / National & International Scenario,
Chapter 3: Analysis & Findings
Chapter 4: Conclusion and Recommendations.

Step V : The following documents are to be attached with the Final Project Report.
1) Approval letter from the supervisor (Annexure-IA)
2) Student's declaration (Annexure-IB)
3) Certificate from the Competent Authority of the Organisation / Institution, if the student undertakes the Project Work in any Organisation / Institution.

Guidelines for Evaluation:

- Each of the students has to undertake a Project individually under the supervision of a teacher and to submit the same following the guidelines stated below.
- Language of Project Report and Viva-Voce Examination may be English. The Project Report must be typed and hard bound.
- Failure to submit the Project Report or failure to appear at the Viva-voce Examination will be treated as "Absent" in the Examination. He /she has to submit the Project Report and appear at the Viva-Voce Examination in the subsequent years (within the time period as per University Rules).
- No marks will be allotted on the Project Report unless a candidate appears at the Viva-Voce Examination. Similarly, no marks will be allotted on Viva-Voce Examination unless a candidate submits his/her Project Report.
- Evaluation of the Project Work to be done jointly by one internal expert and one external expert with equal weightage, i.e., average marks of the internal and external experts will be allotted to the candidate.

WORKSHOP / CERTIFICATION

Course Code: BTE2633 **Credit Units: 02**

Objectives

A workshop is primarily an activity based academic event that is organized to provide the students a one to one and hands on experience on any aspect of their learning. The communication in a workshop has to be necessarily two way. The trainer has to make sure that the aspect covered are practically practiced by the participants. The student will choose the option of workshop from amongst their concentration electives. The evaluation will be done by Board of examiners comprising of the faculties.

Major Themes for Workshop

The workshop may be conducted on any of the following major themes:
Accounting
Finance
Human Resources
Marketing
Economics
Operations
Supply Chain Management
These themes are merely indicative and other recent and relevant topics of study may be included.

Guidelines for Workshop

The procedure for earning credits from workshop consists of the following steps:
Relevant study material and references will be provided by the trainer in advance.
The participants are expected to explore the topic in advance and take active part in the discussions held
Attending and Participating in all activities of the workshop
Group Activities have to be undertaken by students as guided by the trainer.
Evaluation of workshop activities would be done through test and quiz at the end of the workshop.
Submitting a write up of at least 500 words about the learning outcome from the workshop.

Methodology

The methodology followed at the workshop could be based on any one or more of the following methods:
Case Study
Business Game
Simulation
Group Activity
Role Play
Business Planning
Quiz

Evaluation Scheme:

Attendance	Active Participation	Multiple Choice Questions/ Quiz	Solving the case/ Assignment/ Write up	Total
10	30	30	30	100

GENOMICS AND PROTEOMICS

Course Code: BTE2701 **Credit Units: 03**

Course Objective:
The course helps in developing a detailed understanding of eukaryotic genome complexity and organization. Current research on the molecular basis of the control of gene expression in eukaryotic system has developed a detailed understanding of techniques of gene diagnostics and DNA profile to acquire the fundamentals of genomics and Proteomics.

Course Contents:

Module I: Genome Evolution
Origin of genomes, Acquisition of new genes, Noncoding DNA and Genome Evolution, Human Genome Project., Forward genetics (Phenotype to gene structure) and Reverse genetics (Gene structure to phenotype). DNA sequencing – chemical and enzymatic methods

Module II: Structural Genomics
Structural Genomics: Study of 3D- Structure of Protein
Protein Structure, Basics of High Throughput Determination of Protein Structure, Protein Structure Initiative Project, Computational Protein Structure Modeling, Protein Structure and Function.

Module III: Comparative Genomics
Phylogeny, COGS [Cluster of orthologues genes], Introduction to System Biology, Metabolic Reconstruction, The Basic Principles and Methodology. Gene Identification Methods.

Module IV: Functional Genomics
cDNA Microarrays, Oligonucleotide Microarray Chips, Application of Microarrays with examples, Microarray Data Analysis; Real Time PCR.

Module V: Genotyping Background and Applications of Genomics
Genetic and physical mapping, Introduction to molecular markers, DNA fingerprinting, Single nucleotide polymorphisms, RNA interference, antisense RNA, siRNA, MiRNA.

PROTEOMICS

Module VI: Fundamentals of Proteomics
Introduction to Proteomics, 2D Gel Electrophoresis
Protein Identification and Analysis:

a. Protein preparation and Separation
b. Protein Identification by mass spectrometry and its applications.
c. Identification of post translation modification
d. Current concepts of peptide sequencing with MS-MS methods, MALDI-TOF mass spectrometry and nanospray MS

Protein Expression Mapping, Unstructured Proteins.
High-throughput cloning of ORFs, Chromatography
Protein- Protein Interaction Mapping. Its application in health and disease.
Protein Chip/Array. Experimental design and its application. Application of Microarray in proteome analysis.

IPR, BIOSAFETY & BIOETHICS

Course Code: BTE2702 **Credit Units: 02**

Course Objective

The aim of this course is to develop the understanding of relevance, business Impact and protection of Intellectual Property along with the types of Intellectual Property Rights: Patents, Trademarks, Copyrights, Industrial Designs, Geographical Indications and International Conventions, Biosafety and Bioethics

Course Contents

Module I: Basic Principles and Acquisition of Intellectual Property Rights

Basic Principles of Patent Law, Patent Application procedure, Drafting of a Patent Specification, Understanding Copyright Law, Basic Principles of Trade Mark and Design Rights, International Background of Intellectual Property

Module II: Ownership and Enforcement of Intellectual Property Rights

Patents-Objectives, Rights, Assignments, Defences in case of Infringement. Copyright-Objectives, Rights, Transfer of Copyright, work of employment Infringement, Defences for infringement. Trademarks-Objectives, Rights, Protection of goodwill, Infringement, Passing off, Defences. Designs-Objectives, Rights, Assignments, Infringements, Defences of Design Infringement, Enforcement of Intellectual Property Rights - Civil Remedies, Criminal Remedies, Border Security measures, Practical Aspects of Licensing - Benefits, Determinative factors, important clauses, licensing clauses.

Module III: Information Technology Related Intellectual Property Rights

Computer Software and Intellectual Property-Objective, Copyright Protection, Reproducing, Defences, Patent Protection, Database and Data Protection-Objective, Need for Protection, UK Data Protection Act, 1998, US Safe Harbor Principle, Enforcement. Protection of Semi-conductor Chips-Objectives Justification of protection, Criteria, Subject-matter of Protection, WIPO Treaty, Trips, SCPA. Domain Name Protection-Objectives, domain name and Intellectual Property, Registration of domain names, disputes under Intellectual Property Rights, Jurisdictional Issues, International Perspective.

Module IV: Biotechnology and Intellectual Property Rights

Biotechnology and the Law- Objective, Evolution, Basic Structure of Gene Techniques, Applications, Commercial Potential of Biotech Inventions, Rationale for Intellectual Property Protection. Patenting Biotechnology Inventions-Objective, Concept of Novelty, Concept of inventive step, Microorganisms, Moral Issues in Patenting Biotechnological inventions. Plant Varieties Protection-Objectives, Justification, International Position, Plant Varieties Protection in India Protection of Geographical Indications Objectives, Justification, International Position, Multilateral Treaties, National Level, Indian Position.

Module V

Protection of Traditional Knowledge- Objective, Concept of Traditional Knowledge, Holders, Issues concerning, Bio-Prospecting and Bio-Piracy, Alternative ways, Protectability, need for a Sui-Generis regime, Traditional Knowledge on the International Arena, at WTO, at National level, Traditional Knowledge Digital Library.

Module VI

Biosafety and Bioethics Management-Key to environmentally responsible use of biotechnology. Cartagena Protocol on Biosafety, Ethical implications of Biotechnological products and techniques.

RESEARCH METHODOLOGY AND REPORT WRITING

Course Code: BTE2703 **Credit Units: 02**

Course Objective

To develop understanding of information and library science research issues in the domain of bioinformatics through review of journal articles, invited talks, and critical group discussions of methods. The main objectives for this course are to develop: familiarity with information and library science-oriented problems in the biomedical sciences, an understanding of research methods in the biomedical domain, critical thinking and evaluation skills and presentation and summarization skills.

Course Contents

Module I

Introduction: Science, Scientific Field and Biological research. Role of a researcher in different stages of a project, Routes to research funding (academic and commercial)

Module II

Research – Definition – Importance and Meaning of research – Characteristics of research – Types of Research – Steps in research – Identification, Selection and formulation of research problem – Research questions – Research design – Formulation of Hypothesis – Review of Literature.

Module III: Sampling techniques

Sampling theory – types of sampling – Steps in sampling – Sampling and Non-sampling error – Sample size – Advantages and limitations of sampling. Collection of Data: Primary Data – Meaning – Data Collection methods – Secondary data – Meaning - Relevance's, Limitations and cautions. Statistics in Research.

Module IV

Type of Articles (review, letters etc). Scientific paper format (Abstract, Introduction, Materials and Methods, Results, Discussion). Writing, evaluating, presenting and publishing the results of scientific research in the academic press (journals, conferences etc). Choosing the appropriate journal (Sources, Information, Instructions to authors, peer review system, journal evaluation)

Module V

Case studies of areas of current research. Formulating a research plan and its presentation

Examination Scheme:

GENOMICS AND PROTEOMICS LAB

Course Code: BTE2704 **Credit Units: 02**

Course Contents:

Module I
Three dimensional Structures – In silico study – large molecular complexes RNA polymerase II, ribosome, unstructured proteins

Module II
DNA sequencing methods

Module III
Gene finding tools and Genome annotation

Module IV
Comparison of two given genomes

Module V
Analysis of 2D – IEF data

Module VI
Microarray and Microarray data analysis

Module VII
Inference of protein function from structure

Module VIII
Inference of protein function and structure

Module IX
Two-hybrid methods

Examination Scheme:

SUMMER INTERNSHIP EVALUATION-II

Course Code: BTE2735 **Credit Units: 03**

GUIDELINES FOR PROJECT FILE

Research experience is as close to a professional problem-solving activity as anything in the curriculum. It provides exposure to research methodology and an opportunity to work closely with a faculty guide. It usually requires the use of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation.

Research is genuine exploration of the unknown that leads to new knowledge which often warrants publication. But whether or not the results of a research project are publishable, the project should be communicated in the form of a research report written by the student.

Sufficient time should be allowed for satisfactory completion of reports, taking into account that initial drafts should be critiqued by the faculty guide and corrected by the student at each stage.

The File is the principal means by which the work carried out will be assessed and therefore great care should be taken in its preparation.

Methodology

The students will be sent to various industries and institutes where they will undergo short term training. After the completion of the training the students will be required to submit project report which shall then be evaluated by two internal examiners. The students will then have to appear for a Viva Voce examination to be conducted by an external evaluator at the end of the semester.

In general, the File should be comprehensive and include

- A short account of the activities that were undertaken as part of the project;
- A statement about the extent to which the project has achieved its stated goals.
- A statement about the outcomes of the evaluation and dissemination processes engaged in as part of the project;
- Any activities planned but not yet completed as part of the project, or as a future initiative directly resulting from the project;
- Any problems that have arisen that may be useful to document for future reference.

Report Layout

The report should contain the following components:

- **Title or Cover Page**

The title page should contain the following information: Project Title; Student's Name; Course; Year; Supervisor's Name.

- **Acknowledgements** (optional)

Acknowledgment to any advisory or financial assistance received in the course of work may be given.

- **Abstract**

A good "Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard to the objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project

- **Table of Contents**

Titles and subtitles are to correspond exactly with those in the text.

- **Introduction**

Here a brief introduction to the problem that is central to the project and an outline of the structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided.

- **Materials and Methods**

This section should aim at experimental designs, materials used. Methodology should be mentioned in details including modifications if any.

- **Results and Discussion**

Present results, discuss and compare these with those from other workers, etc. In writing these section, emphasis should be given on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in text books. Avoid abrupt changes in contents from section to section and maintain a lucid flow throughout the thesis. An opening and closing paragraph in every chapter could be included to aid in smooth flow.

Note that in writing the various secions, all figures and tables should as far as possible be next to the associated text, in the same orientation as the main text, numbered, and given appropriate titles or captions. All major equations should also be numbered and unless it is really necessary never write in "point" form.

- **Conclusion**

A conclusion should be the final section in which the outcome of the work is mentioned briefly.

- **Future prospects**

- **Appendices**

The Appendix contains material which is of interest to the reader but not an integral part of the thesis and any problem that have arisen that may be useful to document for future reference.

- **References / Bibliography**

This should include papers and books referred to in the body of the report. These should be ordered alphabetically on the author's surname. The titles of journals preferably should not be abbreviated; if they are, abbreviations must comply with an internationally recognised system.

Examples

For research article

Voravuthikunchai SP, Lortheeranuwat A, Ninrprom T, Popaya W, Pongpaichit S, Supawita T. (2002) Antibacterial activity of Thai medicinal plants against enterohaemorrhagic *Escherichia coli* O157: H7. *Clin Microbiol Infec*, **8** (suppl 1): 116–117.

For book

Kowalski, M. (1976) Transduction of effectiveness in *Rhizobium meliloti*. SYMBIOTIC NITROGEN FIXATION PLANTS (editor P.S. Nutman IBP), **7**: 63-67

ASSESSMENT OF THE PROJECT FILE

Essentially, marking will be based on the following criteria: the quality of the report, the technical merit of the project and the project execution.

Technical merit attempts to assess the quality and depth of the intellectual efforts put into the project.

Project execution is concerned with assessing how much work has been put in.

The File should fulfill the following ***assessment objectives:***

Range of Research Methods used to obtain information

Execution of Research

Data Analysis
Analyse Quantitative/ Qualitative information
Control Quality

Draw Conclusions

Examination Scheme:

Project Report	50
Viva Voce	50
Total	**100**

MOLECULAR MEDICINE AND DIAGNOSIS

Course Code: BTE2706 **Credit Units: 02**

Course Contents:

Module I
Human Health and Diseases

Module II
Human Diseases – morbidity, mortality, impact on social development

Module III
Mechanism of disease development, Genetic susceptibility, Identification of targets for diagnosis and therapy: Acquired diseases, cardiovascular diseases, Neurological diseases, Hematology, Cancer

Module IV
Epidemiology of disorders

BIO-ENERGY ENGINEERING

Course Code: BTE2708 **Credit Units: 02**

Course Objective:
The goal is to introduce students to biotechnology and tools that enable engineers and process scientists to connect innovations in industrial microorganisms and bioprocess unit operations to the engineering fundamentals, fundamentals of systems biology, and biological tools for design, modeling and evaluation of manufacturing facilities for the production of biofuels, bioproducts and biotherapeutics using a case study approach combined with computer modeling.

Course Contents:

Module I: Biomass Sources, Characteristics & Preparation
Biomass Sources and Classification. – Chemical composition and properties of different biomass materials and bio-fuels – Sugar cane molasses and other sources for fermentation ethanol-Sources and processing of oils and fats for liquid fuels- Energy plantations
-Preparation of woody biomass: Size reduction, Briquetting of loose biomass, Drying, Storage and Handling of Biomass.

Module II: Biogas, Technology
Feedstock for biogas production, Aqueous wastes containing biodegradable organic matter, animal residues-. Microbial and biochemical aspects- Operating parameters for biogas production Kinetics and mechanism - Dry and wet fermentation. Digesters for rural application-High rate digesters for industrial waste water treatment.

Module III: Bio-Ethanol and Bio-Diesel Technology
Production of Fuel Ethanol by Fermentation of Sugars. Gasohol as a Substitute for Leaded Petrol. - Trans-Esterification of Oils to Produce Bio-Diesel.

Module IV: Pyrolysis and Gasification of Biomass
Thermo-chemical conversion of ligno-cellulose biomass – Biomass processing for liquid fuel production - Pyrolysis of biomass-Pyrolysis regime, effect of particle size, temperature, and products obtained.
Thermo-chemical gasification principles: Effect of pressure, temperature and of introducing steam and oxygen. Design and operation of Fixed and Fluidized Bed Gasifiers.

Module V: Combustion of Biomass and Cogeneration Systems
Combustion of Woody Biomass: Theory, Calculations and Design of Equipments. Cogeneration in Biomass Processing Industries. Case Studies: Combustion of Rice Husk, Use of Bagasse for Cogeneration.

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

TERM PAPER

Course Code: BTE2731 **Credit Units: 02**

METHODOLOGY

A term (or research) paper is primarily a record of intelligent reading in several sources on a particular subject.

The students will choose the topic at the beginning of the session in consultation with the faculty assigned. The progress of the paper will be monitored regularly by the faculty. At the end of the semester the detailed paper on the topic will be submitted to the faculty assigned. The evaluation will be done by Board of examiners comprising of the faculties.

GUIDELINES FOR TERM PAPER

The procedure for writing a term paper may consists of the following steps:

- Choosing a subject
- Finding sources of materials
- Collecting the notes
- Outlining the paper
- Writing the first draft
- Editing & preparing the final paper

1. Choosing a Subject

The subject chosen should not be too general.

2. Finding Sources of materials

m) The material sources should be not more than 10 years old unless the nature of the paper is such that it involves examining older writings from a historical point of view.
n) Begin by making a list of subject-headings under which you might expect the subject to be listed.
o) The sources could be books and magazines articles, news stories, periodicals, scientific journals etc.

3. Collecting the notes

Skim through sources, locating the useful material, then make good notes of it, including quotes and information for footnotes.

m) Get facts, not just opinions. Compare the facts with author's conclusion.
n) In research studies, notice the methods and procedures, results & conclusions.
o) Check cross references.

4. Outlining the paper

i) Review notes to find main sub-divisions of the subject.
j) Sort the collected material again under each main division to find sub-sections for outline so that it begins to look more coherent and takes on a definite structure. If it does not, try going back and sorting again for main divisions, to see if another general pattern is possible.

5. Writing the first draft

Write the paper around the outline, being sure that you indicate in the first part of the paper what its purpose is. You may follow the following:

a) statement of purpose
b) main body of the paper
c) statement of summary and conclusion

Avoid short, bumpy sentences and long straggling sentences with more than one main ideas.

6. Editing & Preparing the final Paper

y) Before writing a term paper, you should ensure you have a question which you attempt to answer in your paper. This question should be kept in mind throughout the paper. Include only information/ details/ analyses of relevance to the question at hand. Sometimes, the relevance of a particular section may be clear to you but not to your readers. To avoid this, ensure you briefly explain the relevance of every section.
z) Read the paper to ensure that the language is not awkward, and that it "flows" properly.
aa) Check for proper spelling, phrasing and sentence construction.
bb) Check for proper form on footnotes, quotes, and punctuation.
cc) Check to see that quotations serve one of the following purposes:
    (xiii) Show evidence of what an author has said.
    (xiv) Avoid misrepresentation through restatement.
    (xv) Save unnecessary writing when ideas have been well expressed by the original author.
dd) Check for proper form on tables and graphs. Be certain that any table or graph is self-explanatory.

Term papers should be composed of the following sections:

- Title page
- Table of contents
- Introduction
- Review
- Discussion & Conclusion
- References
- Appendix

Generally, the introduction, discussion, conclusion and bibliography part should account for a third of the paper and the review part should be two thirds of the paper.

Discussion

The discussion section either follows the results or may alternatively be integrated in the results section. The section should consist of a discussion of the results of the study focusing on the question posed in the research paper.

Conclusion

The conclusion is often thought of as the easiest part of the paper but should by no means be disregarded. There are a number of key components which should not be omitted. These include:

q) summary of question posed
r) summary of findings
s) summary of main limitations of the study at hand
t) details of possibilities for related future research

References

From the very beginning of a research project, you should be careful to note all details of articles gathered.
The bibliography should contain ALL references included in the paper. References not included in the text in any form should NOT be included in the bibliography.
The key to a good bibliography is consistency. Choose a particular convention and stick to this.

Bibliographical conventions
Monographs
Crystal, D. (2001), Language and the internet. Cambridge: Cambridge University Press.

Edited Volumes
Gass, S./Neu, J. (eds.) (1996), Speech acts across cultures. Challenges to communication in a second language. Berlin/ NY: Mouton de Gruyter.
[(eds.) is used when there is more than one editor; and (ed.) where there is only one editor. In German the abbreviation used is (Hrsg.) for Herausgeber].

Edited Articles
Schmidt, R./Shimura, A./Wang, Z./Jeong, H. (1996), Suggestions to buy: Television commercials from the U.S., Japan, China, and Korea. In: Gass, S./Neu, J. (eds.) (1996), Speech acts across cultures. Challenges to communication in a second language. Berlin/ NY: Mouton de Gruyter: 285-316.

Journal Articles
McQuarrie, E.F./Mick, D.G. (1992), On resonance: A critical pluralistic inquiry into advertising rhetoric. Journal of consumer research 19, 180-197.

Unpublished Papers
Takahashi, S./DuFon, M.A. (1989), Cross-linguistic influence in indirectness: The case of English directives performed by native Japanese speakers. Unpublished paper, Department of English as a Second Language, University of Hawai'i at Manoa, Honolulu.

Unpublished Theses/ Dissertations
Möhl, S. (1996), Alltagssituationen im interkulturellen Vergleich: Realisierung von Kritik und Ablehnung im Deutschen und Englischen. Unpublished MA thesis, University of Hamburg.
Walsh, R. (1995), Language development and the year abroad: A study of oral grammatical accuracy amongst adult learners of German as a foreign language. Unpublished PhD dissertation, University College Dublin.

Appendix
The appendix should be used for data collected (e.g. questionnaires, transcripts,...) and for tables and graphs not included in the main text due to their subsidiary nature or to space constraints in the main text.

Assessment Scheme:

Continuous Evaluation: (Based on abstract writing, interim draft, general approach, research orientation, readings undertaken etc.)	40%
Final Evaluation: (Based on the organization of the paper, objectives/ problem profile/ issue outlining, comprehensiveness of the research, flow of the idea/ ideas, relevance of material used/ presented, outcomes vs. objectives, presentation/ viva etc.)	60%

PROJECT

Course Code: BTE2732 **Credit Units: 02**

Objectives:
The aim of the project is to provide the students with an opportunity to further their intellectual and personal development in the chosen field by undertaking a significant practical unit of activity. The project can be defined as a scholarly inquiry into a problem or issues, involving a systematic approach to gathering and analysis of information / data, leading to production of a structured report.

Chapter Scheme and distribution of marks:
Chapter 1: Introduction – 10 marks
Chapter 2: Conceptual Framework/ National/International Scenario – 25 marks
Chapter 3: Presentation, Analysis & Findings -- 25 marks
Chapter 4: Conclusion & Recommendations -- 10 marks
Chapter 5: Bibliography -- 05 marks

Project Report	Power Point Presentation & Viva
75 marks	25 marks

Components of a Project Report
The outcome of Project Work is the Project Report. A project report should have the following components:

1) Cover Page: This should contain the title of the project proposal, to whom it is submitted, for which degree, the name of the author, name of the supervisor, year of submission of the project work, name of the University.

2) Acknowledgement: Various organizations and individuals who might have provided assistance /co-operation during the process of carrying out the study.

3) Table of Content: Page-wise listing of the main contents in the report, i.e., different Chapters and its main Sections along with their page numbers.

4) **Body of the Report:** The body of the report should have these four logical divisions
a) ***Introduction:*** This will cover the background, rationale/ need / justification, brief review of literature, objectives, methodology (the area of the study, sample, type of study, tools for data collection, and method of analysis), Limitations of the Study, and Chapter Planning.
b) ***Conceptual Framework / National and International Scenario*****:** (relating to the topic of the Project).
c***) Presentation of Data, Analysis and Findings*****:** (using the tools and techniques mentioned in the methodology).
d) ***Conclusion and Recommendations:*** In this section, the concluding observations based on the main findings and suggestions are to be provided.

5) Bibliography or References: This section will include the list of books and articles which have been used in the project work, and in writing a project report.

6) Annexures: Questionnaires (if any), relevant reports, etc.
(The main text of the Project should normally be in the range of 5000 words. However, there may be annexure in addition to the main text)

The Steps of a Project Report

Step I : Selection of the topic for the project by taking following points into consideration:

- Suitability of the topic.
- Relevance of the topic
- Time available at the disposal.
- Feasibility of data collection within the given time limit.
- Challenges involved in the data collection (time & cost involved in the data collection, possibility of getting responses, etc.)

Step II : Finalisation of the Topic and preparation of Project Proposal in consultation with the Supervisor.

Step III : Collection of information and data relating to the topic and analysis of the same.

Step IV: Writing the report dividing it into suitable chapters, viz.,

Chapter 1: Introduction,
Chapter 2: Conceptual Framework / National & International Scenario,
Chapter 3: Analysis & Findings
Chapter 4: Conclusion and Recommendations.

Step V: The following documents are to be attached with the Final Project Report.

1) Approval letter from the supervisor (Annexure-IA)
2) Student's declaration (Annexure-IB)
3) Certificate from the Competent Authority of the Organisation / Institution, if the student undertakes the Project Work in any Organisation / Institution.

Guidelines for Evaluation:

- Each of the students has to undertake a Project individually under the supervision of a teacher and to submit the same following the guidelines stated below.
- Language of Project Report and Viva-Voce Examination may be English. The Project Report must be typed and hard bound.
- Failure to submit the Project Report or failure to appear at the Viva-voce Examination will be treated as "Absent" in the Examination. He /she has to submit the Project Report and appear at the Viva-Voce Examination in the subsequent years (within the time period as per University Rules).
- No marks will be allotted on the Project Report unless a candidate appears at the Viva-Voce Examination. Similarly, no marks will be allotted on Viva-Voce Examination unless a candidate submits his/her Project Report.
- Evaluation of the Project Work to be done jointly by one internal expert and one external expert with equal weightage, i.e., average marks of the internal and external experts will be allotted to the candidate.

WORKSHOP / CERTIFICATION

Course Code: BTE2733 **Credit Units: 02**

Objectives

A workshop is primarily an activity based academic event that is organized to provide the students a one to one and hands on experience on any aspect of their learning. The communication in a workshop has to be necessarily two way. The trainer has to make sure that the aspect covered are practically practiced by the participants. The student will choose the option of workshop from amongst their concentration electives. The evaluation will be done by Board of examiners comprising of the faculties.

Major Themes for Workshop

The workshop may be conducted on any of the following major themes:
Accounting
Finance
Human Resources
Marketing
Economics
Operations
Supply Chain Management
These themes are merely indicative and other recent and relevant topics of study may be included.

Guidelines for Workshop

The procedure for earning credits from workshop consists of the following steps:
Relevant study material and references will be provided by the trainer in advance.
The participants are expected to explore the topic in advance and take active part in the discussions held
Attending and Participating in all activities of the workshop
Group Activities have to be undertaken by students as guided by the trainer.
Evaluation of workshop activities would be done through test and quiz at the end of the workshop.
Submitting a write up of at least 500 words about the learning outcome from the workshop.

Methodology

The methodology followed at the workshop could be based on any one or more of the following methods:
Case Study
Business Game
Simulation
Group Activity
Role Play
Business Planning
Quiz

Evaluation Scheme:

Attendance	Active Participation	Multiple Choice Questions/ Quiz	Solving the case/ Assignment/ Write up	Total
10	30	30	30	100

PROJECT/ DISSERTATION

Course Code: BTE2837 **Credit Units: 17**

Course Objective:
The students are expected to utilize their scheduled periods by undertaking the project that would be completed during the semester

Every student shall undertake a major Project. The major Project shall be undertaken in some biotechnology industry or laboratory of repute. Each student shall be assigned to a faculty who shall continuously monitor the progress of the Project in the concerned laboratory or industry. The faculty, in consultation with the concerned scientist of the industry/laboratory, shall decide the topic of the project. At the conclusion of the project the student shall submit a seminar and a dissertation. The dissertation shall be evaluated by the internal faculty/examiner. The student then shall have to appear for the viva voce examination.

GUIDELINES FOR PROJECT FILE
Research experience is as close to a professional problem-solving activity as anything in the curriculum. It provides exposure to research methodology and an opportunity to work closely with a faculty guide. It usually requires the use of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation.

Research is genuine exploration of the unknown that leads to new knowledge which often warrants publication. But whether or not the results of a research project are publishable, the project should be communicated in the form of a research report written by the student.

Sufficient time should be allowed for satisfactory completion of reports, taking into account that initial drafts should be critiqued by the faculty guide and corrected by the student at each stage.

The File is the principal means by which the work carried out will be assessed and therefore great care should be taken in its preparation.

In general, the File should be comprehensive and include
- A short account of the activities that were undertaken as part of the project;
- A statement about the extent to which the project has achieved its stated goals.
- A statement about the outcomes of the evaluation and dissemination processes engaged in as part of the project;
- Any activities planned but not yet completed as part of the project, or as a future initiative directly resulting from the project;
- Any problems that have arisen that may be useful to document for future reference.

Report Layout
The report should contain the following components:

- **Title or Cover Page**

The title page should contain the following information: Project Title; Student's Name; Course; Year; Supervisor's Name.

- **Acknowledgements** (optional)

Acknowledgment to any advisory or financial assistance received in the course of work may be given.

- **Abstract**

A good "Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard to the objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project

- **Table of Contents**

Titles and subtitles are to correspond exactly with those in the text.

- **Introduction**

Here a brief introduction to the problem that is central to the project and an outline of the structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided.

- **Materials and Methods**

This section should aim at experimental designs, materials used. Methodology should be mentioned in details including modifications if any.

- **Results and Discussion**

Present results, discuss and compare these with those from other workers, etc. In writing these section, emphasis should be given on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in text books. Avoid abrupt changes in contents from section to section and maintain a lucid flow throughout the thesis. An opening and closing paragraph in every chapter could be included to aid in smooth flow.

- Note that in writing the various secions, all figures and tables should as far as possible be next to the associated text, in the same orientation as the main text, numbered, and given appropriate titles or captions. All major equations should also be numbered and unless it is really necessary never write in "point" form.

- **Conclusion**

A conclusion should be the final section in which the outcome of the work is mentioned briefly.

MICROBIOLOGY LAB

Course Code: BTH4109 **Credit Units: 02**

Course Objectives
The objective of this laboratory course is to provide practical skills on basic microbiological techniques

Learning Outcomes
- Students should be able to:
- Isolate, characterize and identify common bacterial organisms;
- Determine bacterial load of differentsamples;
- Perform antimicrobial sensitivity tests;
- Preserve bacterial cultures

Course Contents:

Sterilization, disinfection and safety in microbiologicallaboratory.
Preparation of media for cultivation of bacteria.
Isolation of bacteria in pure culture by streak plate method.
Study of colony and growth characteristics of some common bacteria:
Bacillus, E. coli, Staphylococcus, Streptococcus, etc.
Preparation of bacterial smear and Gram's staining.
Enumeration of bacteria: standard plate count.
Antimicrobial sensitivity test and demonstration of drug resistance.
Maintenance of stock cultures: slants, stabs and glycerol stock cultures
Determination of phenol co-efficient of antimicrobial agents.
Determination of Minimum Inhibitory Concentration (MIC)

BIOCHEMISTRY & ANALYTICAL TECHNIQUES LAB

Course Code: BTH4115 **Credit Units: 04**

Course Objectives

The objective of this laboratory course is to introduce students to experiments in biochemistry. The course is designed to teach students the utility of set of experimental methods in biochemistry in a problem oriented manner.

Learning Outcomes

On completion of this course, students should be able to:
To elaborate concepts of biochemistry with easy to run experiments;
To familiarize with basic laboratory instruments and understand the
principle of measurements using those instruments with experiments in biochemistry.

Course Contents:

Preparingvariousstocksolutionsandworkingsolutionsthatwillbeneeded for the course.
To prepare an Acetic-Na Acetate Buffer and validate the Henderson-Hassel bach equation.
To determine an unknown protein concentration by plotting a standard graph of BSA using UV-Vis Spectrophotometer and validating the Beer- Lambert's Law.
Titration of Amino Acids and separation of aliphatic, aromatic and polar amino acids by thin layer chromatography.
Purification and characterization of an enzyme from a recombinant source (such as Alkaline Phosphatase or Lactate Dehydrogenase or any enzyme of the institution's choice).
Preparation of cell-free lysates
Ammonium Sulfate precipitation
Ion-exchange Chromatography
Gel Filtration
Affinity Chromatography
Dialysis of the purified protein solution against 60% glycerol as ademonstration of storage method
Generating a Purification Table (protein concentration, amount of total protein; Computing specific activity of the enzyme preparation at each stage of purification)
Assessing purity of samples from each step of purification by SDS-PAGE Gel Electrophoresis
Enzyme Kinetic Parameters: Km, Vmax and Kcat
Experimental verification that absorption at OD260 is more for denatured DNAas compared to native double stranded DNA. reversal of the same following DNA renaturation. Kinetics of DNA renaturation as a function of DNA size.
Identification of an unknown sample as DNA, RNA or protein using available laboratory tools. (Optional Experiments)
Biophysical methods (Circular Dichroism Spectroscopy, Fluorescence Spectroscopy).
Determination of mass of small molecules and fragmentation patterns by Mass Spectrometry.

PLANT AND ANIMAL BIOTECHNOLOGY LAB

Course Code: BTH4116 **Credit Units: 04**

Course Objectives

The objectives of this course are to provide hands-on training in basic experiments of plant and animal biotechnology.

Learning Outcomes

On completion of course, students should be able to gain basic skills in plant and animal biotechnology.

Course Contents:

Plant Biotechnology

Prepare culture media with various supplements for plant tissue culture.
Prepare explants of Valleriana wallichii for inoculation under aseptic conditions.
Attempt in vitro andro and gynogenesis in plants (Datura stramonium).
Isolate plant protoplast by enzymatic and mechanical methods and attempt fusion by PEG (available material).
Culture Agrobacterium tumefaciens and attempt transformation of any dicot species.
Generate an RAPD and ISSR profile of Eremurus persicus and Valleriana wallichii.
Prepare karyotypes and study the morphology of somatic chromosomes of Allium cepa, A. sativum, A. tuberosum and compare them on the basis of karyotypes.
Pollen mother cell meiosis and recombination index of select species
(one achiasmate, and the other chiasmate) and correlate with generation of variation.
Undertake plant genomic DNA isolation by CTAB method and its quantitation by visual as well as spectrophotometeric methods.
Perform PCR amplification of 'n' number of genotypes of a species for studying the genetic variation among the individuals of a species using random primers.
Study genetic fingerprinting profiles of plants and calculate polymorphic information content.
Syllabus

Animal Biotechnology

Count cells of an animal tissue and check their viability.
Prepare culture media with various supplements for plant and animal tissue culture.
Prepare single cell suspension from spleen and thymus.
Monitor and measure doubling time of animal cells.
Chromosome preparations from cultured animal cells.
Isolate DNA from animal tissue by SDS method.
Attempt animal cell fusion using PEG

RESEARCH METHODOLOGY AND SCIENTIFIC COMMUNICATION SKILLS

Course Code: BTH4214 **Credit Units: 02**

Course Objectives
The objectives of this course are to give background on history of science, emphasizing methodologies used to do research, use framework of these

Learning Outcomes
Students should be able to: Understand history and methodologies of scientific research, applying theset o recent published papers; Understand and practice scientific reading, writing and presentations;
Appreciate scientific ethics through case studies

Course Contents:

Module 1 History of science and science methodologies
Empirical science; scientific method; manipulative experiments and controls; deductive and inductive reasoning; descriptive science; reductionist vs holistic biology.

Module 2 Preparation for research
Choosing a mentor, lab and research question; maintaining a lab notebook

Module 3 Process of communication
Concept of effective communication- setting clear goals for communication; determining outcomes and results; initiating communication; avoiding breakdowns while communicating; creating value in conversation; barriers to effective communication; non-verbal communication-interpreting non-verbal cues; importance of body language, power of effective listening; recognizing cultural differences;Presentationskills-formal presentation skills; preparing and presenting using over-head projector, PowerPoint; defending interrogation; scientific poster preparation & presentation; participating in group discussions; Computing skills for scientific research - web browsing for information search; search engines and their mechanism of searching; hidden Web and its importance in scientific research; internet as a medium of interaction between scientists; effective email strategy using the right tone and conciseness.

Module 4 Scientific communication
Technical writing skills - types of reports; layout of a formal report; scientific writing skills - importance of communicating science; problems while writing a scientific document; plagiarism, software for plagiarism; scientific publication writing: elements of a scientific paper including abstract, introduction, materials & methods, results, discussion, references; drafting titles and framing abstracts; publishing scientific papers- peer review process and problems, recent developments such as open access and non-blindreview;plagiarism;characteristicsofeffectivetechnicalcommunication;scientific presentations; ethical issues; scientific misconduct

BIO-ENTREPRENEURSHIP, INTELLECTUAL PROPERTY RIGHTS, BIOSAFETY AND BIOETHICS

Course Code: BTH4306 **Credit Units: 03**

Course Objectives

Bio-entrepreneurship, an interdisciplinary course, revolves around the central theme of how to manage and develop life science companies and projects. The objectives of this course are to teach students about concepts of entrepreneurship including identifying a winning business opportunity, gathering funding and launching a business, growing and Nurturing the organization and harvesting the rewards.

The other objectives are To understand basic knowledge, policies, requirements, and laws of IPR, Biosafety, and Bio-ethics.

Learning Outcomes

Students should be able to gain entrepreneurial skills, understand the various operations involved in venture creation, identify scope for entrepreneurship in biosciences and utilize the schemes promoted through knowledge centres and various agencies. Understand the rationale for and against IPR and especially patients; Understand why India has adopted an IPR Policy and be familiar with broad outline of patent regulations; Understand different types of IPR.

Course Contents:

Module1 Innovation and entrepreneurship in bio-business

Introduction and scope in Bio-entrepreneurship, Types of bio-industries and competitive dynamicsbetweenthesub-industriesofthebiosector(e.g.pharmaceuticalsvs.Industrial biotech),Strategyandoperationsofbio-sectorfirms:Factorsshapingopportunitiesfor innovation and entrepreneurship in bio-sectors, and the business implications of those opportunities, Alternatives faced by emerging bio-firms and the relevant toolsforstrategicdecision,Entrepreneurshipdevelopmentprogramsofpublicandprivateagencies(MSME, DBT,BIRAC,MakeInIndia),strategicdimensionsofpatenting&commercialization strategies.

Module2 Bio markets - business strategy and marketing

Negotiating the road from lab to the market (strategies and processes of negotiation with financiers, government and regulatory authorities), Pricing strategy, Challenges in marketing in bio business (market conditions & segments; developing distribution channels, the nature, analysis and management of customer needs), Basic contract principles, different types of agreement and contract terms typically found in joint venture and development agreements, Dispute resolution skills.

Module3 Finance and accounting

Business plan preparation including statutory and legal requirements, Business feasibility study, financial management issues of procurement of capital and management of costs, Collaborations & partnership, Information technology.

Module4 Technology management

Technology–assessment,development&upgradation,Managingtechnologytransfer, Qualitycontrol&transferofforeigntechnologies,KnowledgecentersandTechnology transfer agencies, Understanding of regulatory compliances and procedures (CDSCO, NBA, GCP, GLA,GMP

Module5

Introduction to IPR

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Introduction to intellectual property; types of IP: patents, trademarks, copyright & related rights, industrial design, traditional knowledge, geographical indications, protection of new GMOs; International framework for the protection of IP; IP as a factor inR&D;IPsofrelevancetobiotechnologyandfewcasestudies;introductiontohistoryof GATT, WTO, WIPO and TRIPS; plant variety protection and farmers rights act; concept of 'prior art': invention in context of "prior art"; patent databases - country-wise patent searches(USPTO,EPO,India);analysis andreport formation.

Module6 Patenting

Basics of patents: types of patents; Indian Patent Act 1970; recent amendments; WIPO Treaties; Budapest Treaty; Patent Cooperation Treaty (PCT) and implications; procedure forfilingaPCTapplication;roleofaCountryPatentOffice;filingofapatentapplication; precautions before patenting-disclosure/non-disclosure - patent application-forms
and guidelines including those of National Bio-diversity Authority (NBA) and other regulatory bodies, fee structure, time frames; types of patent applications: provisional and complete specifications; PCT and conventional patent applications; international patenting-requirement, procedures and costs; financial assistance for patenting- introductiontoexistingschemes;publicationofpatents-gazetteofIndia,statusinEurope and US; patent infringement- meaning, scope, litigation, case studies and examples; commercialization of patented innovations; licensing – outright sale, licensing, royalty; patenting by research students and scientists-university/organizational rules in India and abroad, collaborative research - backward and forward IP; benefit/credit sharing among parties/community, commercial (financial) and non-commercial incentives.

Module 7 Biosafety

Biosafety and Biosecurity - introduction; historical background; introduction to biologicalsafetycabinets;primarycontainmentforbiohazards;biosafetylevels;GRAS
organisms,biosafetylevelsofspecificmicroorganisms;recommendedbiosafetylevels
forinfectiousagentsandinfectedanimals;definitionofGMOs&LMOs;principlesof safety assessment of transgenic plants – sequential steps in risk assessment; concepts offamiliarityandsubstantialequivalence;risk–environmentalriskassessmentand
food and feed safety assessment; problem formulation – protection goals,compilation ofrelevantinformation,riskcharacterizationanddevelopmentofanalysisplan;risk
assessment of transgenic crops *vs* cisgenic plants or products derived from RNAi, genome editing tools.

Module 8 Nationaland international regulations

International regulations – Cartagena protocol, OECD consensus documents and Codex Alimentarius; Indian regulations – EPA act and rules, guidance documents, regulatoryframework–RCGM,GEAC,IBSCandotherregulatorybodies;Draftbill ofBiotechnologyRegulatoryauthorityofIndia-containments–biosafetylevelsand
category of rDNA experiments; field trails – biosafety research trials – standard operating procedures - guidelines of state governments; GM labeling – Food Safety and Standards Authority of India (FSSAI).

Module 9 Bioethics

Introduction, ethical conflicts in biological sciences - interference with nature, bioethics in health care - patient confidentiality, informed consent, euthanasia, artificialreproductivetechnologies,prenataldiagnosis,geneticscreening,genetherapy, transplantation. Bioethics in research – cloning and stem cell research, Humanand
animal experimentation, animal rights/welfare, Agricultural biotechnology - Genetically engineered food, environmental risk, labeling and public opinion. Sharing benefits and protecting future generations - Protection of environment and biodiversity – biopiracy.

BIOPROCESS ENGINEERING & TECHNOLOGY LAB

Course Code: BTH4323 **Credit Units: 03**

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Course Objectives

The objectives of this laboratory course are to provide hands-on training to students in upstream and downstream unit operations

Learning Outcomes

Students should be able to:

- Investigate, design and conduct experiments, analyze and interpret data, and apply the laboratory skills to solve complex bioprocess engineering problems; Apply skills and knowledge gained will be useful in solving problems typical of bio industries and research

Course Contents:

1. Basic Microbiologytechniques
   a) Scaleupfromfrozenvialtoagarplatetoshakeflaskculture.
   b) Instrumentation: Microplate reader, spectrophotometer,microscopy.
   c) Isolation of microorganisms from soil samples.
2. Experimental set-up
   a) Assembly of bioreactor and sterilization.
   b) Growth kinetics.
   c) Substrate and product inhibition.
   d) Measurement of residual substrates.
3. Data Analysis
   a) Introduction to Metabolic Flux Analysis(MFA).
4. Fermentation
   a) Batch.
   b) Fed-batch.
   c) Continuous.
5. Unit operations
   a) Micro filtration: Separation of cells from broth.
   b) Bio separations: Various chromatographic techniques and extractions.
6. Bioanalytic
   a) AnalyticaltechniqueslikeHPLC,FPLC,GC,GC-MSetc.formeasurement of amounts of products/substrates.

BIOINFORMATICS LAB

Course Code: BTH4324 **Credit Units: 03**

Course Objectives

The aim of this course is to provide practical training in bioinformatic methods including accessing major public sequence databases, use of different computational tools to find sequences, analysis of protein and nucleic acid sequences by various software packages

Learning Outcomes

On completion of this course, students should be able to: Describe contents and properties of most important bioinformatics databases;

- Perform text- and sequence-based searches and analyze and discuss results in light of molecular biological knowledge;
- Explain major steps in pairwise and multiple sequence alignment, explain principle and execute pairwise sequence alignment by dynamic programming;P redict secondary and tertiary structures of protein sequences

Course Contents:

Using NCBI and Uniprot webresources.
Introduction and use of various genomedatabases.
Sequenceinformationresource:UsingNCBI,EMBL,Genbank,Entrez,Swissprot/ TrEMBL,UniProt.
SimilaritysearchesusingtoolslikeBLASTandinterpretationofresults.
Multiple sequence alignment usingClustalW.
Phylogenetic analysis of protein and nucleotidesequences.
Use of gene prediction methods (GRAIL, Genscan,Glimmer).
Using RNA structure predictiontools.
Use of various primer designing and restriction site predictiontools.
Use of different protein structure prediction databases (PDB,SCOP, CATH).
Construction and study of protein structures usingDeepview/PyMol.
Homology modelling ofproteins.
Useoftoolsformutationandanalysisoftheenergyminimizationof proteinstructures.
Use of miRNA prediction, designing and target predictiontools.

ENVIRONMENTAL BIOTECHNOLOGY

Course Code: BTH4204 **Credit Units: 02**

Course Objectives

This course aims to introduce fundamentals of Environmental Biotechnology. The course will introduce major groups of micro organisms tools in biotechnology and their most important environmental applications. The environmental applications of biotechnology will be presented in detail and will be supported by examples from the national and international literature.

Student Learning Outcomes

On completion of course, students will be able to understand use of basic microbiological, molecular and analytical methods, which are extensively used in environmental biotechnology.

Course Contents:

Module I: Introduction to environment.

Introduction to environment; pollution and its control; pollution indicators; waste management: domestic, industrial, solid and hazardous wastes; strain improvement; Biodiversity and its conservation; Role of microorganisms in geochemical cycles; microbial energy metabolism, microbial growth kinetics and elementary chemostat theory, relevant microbiological processes, microbial ecology.

Module II: Bioremediation

Bioremediation: Fundamentals, methods and strategies of application (biostimulation, bioaugmentation)–examples,bioremediationofmetals(Cr,As,Se,Hg),radionuclides (U,Te),organicpollutants(PAHs,PCBs,Pesticides,TNT*etc.*),technologicalaspectsof bioremediation (*in situ, exsitu*).

Module III: Role of microorgan- isms in bioremediation

Application of bacteria and fungi in bioremediation: White rot fungi *vs* specialized degradingbacteria:examples,usesandadvantages*vs*disadvantages;Phytoremediation: Fundamentals and description of major methods of application (phytoaccumulation, phytovolatilization, rhizo-filtrationphyto-stabilization).

Module IV: Biotechnology and agriculture

Bioinsecticides: Bacillus thuringiensis, Baculoviruses, uses, genetic modifications and aspects of safety in their use; Biofungicides: Description of mode of actions and mechanisms (e.g. Trichoderma, Pseudomonas fluorescens); Biofertilizers: Symbiotic systems between plants – microorganisms (nitrogen fixing symbiosis, mycorrhiza fungi symbiosis), Plant growth promoting rhizobacteria (PGPR) – uses, practical aspects and problems in application.

Module V: Biofuels

EnvironmentalBiotechnologyandbiofuels:biogas;bioethanol;biodiesel;biohydrogen; Description of the industrial processes involved, microorganisms and biotechnological interventions for optimization of production; Microbiologically enhanced oil recovery (MEOR); Bioleachingofmetals; Production of bioplastics; Production of biosurfactants: bioemulsifiers; Paperproduction: use of xylanases and whiterotfungi.

VACCINES

Course Code: BTH4327 **Credit Units: 02**

Course Objectives

This course will provide students with an overview of current developments in different areas of vaccines.

Learning Outcomes

By the end of this course, students should be able to:

- Understand fundamental concepts of human immune system and basic immunology;
- Differentiate and understand immune responses in relation to infection and vaccination;
- Understand requirement and designing of different types of vaccines;
- Understand importance of conventional and new emerging vaccine technologies.

Course Contents:

Module 1 Fundamentals of immune system

Overview of Immune system; Human Immune system: Effectors of immune system; Innate & Adaptive Immunity; Activation of the Innate Immunity; Adaptive Immunity; T and B cells in adaptive immunity; Immune response in infection; Correlates of protection.

Module 2 Immune response to infection

Protective immune response in bacterial; viral and parasitic infections; Primary and Secondary immune responses during infection; Antigen presentation and Role of Antigen presenting cells: Dendriticcells in immune response; Innate immune response Humoral (antibody mediated) responses; Cell mediated responses: role of CD4+ and CD8+ T cells; Memory responses: Memory and effector T and B cells, Generation and Maintenance of memory T and Bcells

Module 3 Immune response to vaccination

Vaccination and immune response; Adjuvants in Vaccination; Modulation of immune responses: Induction of Th1 and Th2 responses by using appropriate adjuvants and antigendeliverysystems-Microbialadjuvants, LiposomalandMicroparticlesas delivery systems; Chemokines and cytokines; Role of soluble mediators in vaccination; Oral immunization and Mucosal Immunity**.**

Module 4 Vaccine types& Design

Historyofvaccines,Conventionalvaccines;Bacterialvaccines;ViralVaccines;Vaccines based on routes of administration: parenteral, oral, mucosal; Live attenuated and inactivated vaccine; Subunit Vaccines and Toxoids; Peptide Vaccine.

Module 5 Vaccine technologies

New Vaccine Technologies; Rationally designed Vaccines;DNAVaccination;Mucosal vaccination; New approaches for vaccine delivery; Engineering virus vectors for vaccination;Vaccinesfortargeteddelivery(VaccineDeliverysystems);Diseasespecific vaccine design: Tuberculosis Vaccine; Malaria Vaccine; HIV/AIDS vaccine; New emerging diseases and vaccine needs (Ebola,Zika).

RNA BIOLOGY

Course Code: BTH4219 **Credit Units: 02**

Course Objectives

A) Learn basic tenets of RNA Biology

B) Explore emerging topics in RNA Biology including CRISPR/Cas9, differential RNA processing and stability, RNA Epi-transcriptomics, and functions of diverse classes of non-coding RNAs

Learning Outcomes

On successful completion of this course, students should be able to This course will focus on recent research in RNA biology: differential RNA processing and stability (splicing, polyadenylation, and turnover), the functional significance of various classes of non-coding RNAs (microRNAs, lncRNAs, cRNAs, ceRNAs, eRNAs, etc…), the CRISPR/Cas9 system, and RNA epi-transcriptomics (RNA methylation and terminal uridylation). Class lectures and discussions will be predominantly.

Course Contents:

Module1 Introduction to RNA biology

Introduction to RNA Biology and the Course Objectives, RNA Processing and Turnover, RNA and Translation, RNA Editing, Modifications and the Epi-transcriptome. The functions of Noncoding RNAs; the Long and the Short of it.

Module2 RNA therapeutics

RNA-based approaches to target identification and validation: Microarray, miRNAs; RNAi and CRISPR functional screens

2. RNA Therapeutic approaches: Gene therapy issues, Antisense, Ribozymes
3. RNA Therapeutic approaches: Aptamers, Riboswitches
4. RNA Therapeutic approaches: RNAi
5. RNA Therapeutic approaches: CRISPR, Combination therapies, Nano-formulations
6. RNA Therapeutic Efficacy considerations: Chemical modifications, Delivery challenges

CANCER BIOLOGY

Course Code: BTH4328 **Credit Units: 02**

Course Objectives

The Cancer Biology elective course will provide knowledge of critical aspects in human cancer biology for better understanding of its development, diagnostics methods as well as clinical/experimental therapeutics available for cancer therapy.

This course provides students with a broad overview of diverse fields of oncology, covering historical perspectives to cutting-edge approaches. The course will span several aspects of cancer research including its genetics, molecular and cellular biology, cancer micro-environment and its physiology, as well as classical vs experimental therapies available for tumor treatment. This course should specially be appealing to students who are interested in studying cancer research for their future career paths.

Learning outcomes:

On completion of this course, students should be able to:

- Describe tumor progression and important 'hallmarks' of cancer
- Understanding of the molecular and cellular origins of cancer
- Key signaling pathways in cancer development and progression
- knowledge of current perspectives about cancer research and current therapies.

Course Contents:

Module1 Introduction

Cancer hallmarks, Carcinogenesis, Oncogenes and tumor viruses, Tumor suppressor genes.

Module2 Cancer signaling

Signal transduction programs in cancer, De-regulation of the cell cycle/cell growth in cancer, Genomic instability and DNA repair in cancer, Apoptosis (p53), autophagy and cancer metabolism

Module3 Cell biology of cancer

The cancer microenvironment – hypoxia, inflammation, angiogenesis and stromal-cancer interactions, Invasion and Metastasis.

Module4 Diagnostics of cancer

Tumor immunology and immunotherapy, Cancer diagnostics – biomarkers, Cancer therapies, Translational research

Examination Scheme:

Syllabus – First Semester

BIOCHEMISTRY AND METABOLIC REGULATION

Course Code: BTE4101 **Credit Units: 02**

Course Objective:
The primary focus of this course is metabolic regulation of carbohydrates, lipids and nitrogenous compounds. It is also aimed to expose the students to the technological applications in understanding the process of photosynthesis, and production of secondary metabolites through metabolic engineering. It is expected that the knowledge consolidated would help them to explore further into these areas by undertaking advanced research and studies.

Course Contents:

Module I
Carbohydrate and lipid metabolism: Glycolysis, Kreb's cycle, Electron Transport chain (ETS), energetics and regulation of these pathways, HMP pathway and its importance, gluconeogenesis, mechanism of oxidative phosphorylation (Chemiosmotic theory), fatty acid oxidation and their metabolic routes to carbon, biosynthesis of lipids (fatty acids and sterols), glycogen metabolism.

Module II
Protein and nucleotide metabolism: oxidative deamination, decarboxylation and transamination reactions, Urea cycle, overview of biosynthetic families of amino acids, denovo synthesis, breakdown and regulation of purine and pyrimidine nucleotides, salvage pathways of nucleotide synthesis; biosynthesis of nucleotide co-enzymes NAD, NADP, FAD and FMN .

Module III
Integration of cellular metabolism and hormonal regulation: Action of major hormones (insulin, glucagons, epinephrine) responses to metabolic stress; starvation, metabolic disorders (phenylketonuria, arthritis) and role of antifolates in chemotherapy.

Module IV:
Regulatory aspects of photosynthesis: Mechanism of light interacting with photo pigments, energy transfer and transduction process during photosynthesis, artificial light harvesting system and application in carbon sequestration , Engineering of Rubisco enzyme for photosynthetic process optimization.

Module V Secondary plant metabolism
Importance of secondary metabolites, classification, terpenes, mevalonic acid pathway, phenolic compounds and alkaloids. Application of metabolic engineering in production of any two class of secondary metabolites. Contribution of metabolic engineering principles in promoting Green Chemistry.

GENETICS AND MOLECULAR BIOLOGY

Course Code: BTE4102 **Credit Units: 03**

Course objective

Knowledge of genetics is fundamental to any field of biotechnology. Molecular biology has brought new dimension to the discipline of genetics in every sense of the word. The course is structured to achieve a balance somewhere between genetics and molecular biology for the student to get a "feel" for what are these overlapping disciplines all about

Course Contents:

Module I

Historical developments in genetics leading to evolution of molecular biology.DNA as genetic material, structure of DNA and RNA, complimentarity, phosphodiester bond, denaturation and reassociation. Basic methods used in studying nucleic acids.

DNA replication, DNA polymerases, modes of replication ,mechanism of replication in *E.coli*, synthesis of leading and lagging strands, DNA replication in eukaryotes.

Module II

Mendels laws of inheritance, alleles and multiple alleles, pedigree analysis in humans, gene interaction, epistasis , mitosis and meiosis, chromosomal basis of inheritance, cell cycle, sex determination in *Drosophila* and humans, sex chromosomes and sex linked inheritance. Dosage compensation.

Module III

Concept of linkage and gene mapping in eukaryotes. Molecular markers and their utility in genetic mapping , , molecular basis of recombination .

Evolution of gene concept.Fine structure mapping, Benzers T4, rII system, complementation and recombination.Bacterial genetics – conjugation and transduction.

Module IV

Genome organization in prokaryotes and eukaryotes (nuclear, chloroplast and mitochondria), genes and pseudogenes, repeated sequences. Transposable elements – transposons, retotransposons C value paradox.

Chromosome structure: heterochromatin ,euchromatin, histone proteins, histone code.

Chromosomal rearrangements, aneuploidy, chromosomal human diosorders.

Module V

Transcription: Gene structure: promoter and coding sequences, regulatory and transcription units, RNA polymerases, basic mechanism of transcription (initiation, elongation and termination) in prokaryotes and eukaryotes, tRNAs, rRNA.

Salient fatures of genetic code.

Translation – initiation, elongation and termination.

Module VI

Regulation of gene expression, Prokaryotes negative and positive regulation, attenuation.

Eukaryotes: Transcription factors, activators and enhancers.

INSTRUMENTATION AND RESEARCH METHODOLOGY

Course Code: BTE4103 **Credit Units: 02**

Course Objective:
To provide knowledge on key features and applications of the equipment particularly used in molecular biology, protein engineering and analysis of the structure of bio-molecules. An introductory session will be conducted on the basic instruments used in biotechnology, keeping in mind the requirements of the students who have not done B.Tech Biotechnology. Research methodology is aimed to expose and inculcate the research spirit among the students. The course is expected to impart in depth understanding of various steps of research such as formulation of research problem, construction of research design, data collection and generation of a research report. It will also develop the skill of scientific writing.

Course Contents:

Module I: Instruments used in Molecular biology
PCR system; Quantitative and real time PCR, Nucleotide sequencing of DNA (DNA sequencer), Flow cytometer, Microarrays and DNA chips, Gel-Documentation and Image analysis systems, Radioimmunoassay, ELISA

Module II: Cell Disruption Techniques
Chemical and Physical cell disruption techniques: homogenizers, sonicators, permeabilization techniques

Module III: Characterization of Molecules
Mass spectrometry, MALDI, ESI-MS; Nuclear Magnetic Resonance spectroscopy, ^{1}H NMR, ^{13}C NMR, MRI; X-ray Crystallography and analysis of data to predict a protein structure

Module IV
Research – Definition – Importance and Meaning of research – Characteristics of research – Types of Research – Steps in research – Identification, Selection and formulation of research problem – Research questions – Research design – Formulation of Hypothesis – Review of Literature

Module V
Formulation of research plan, report, Type of Articles (review, letters etc). Scientific paper format (Abstract, Introduction, Materials and Methods, Results, Discussion). Writing, evaluating, presenting and publishing the results of scientific research in the academic press (journals, conferences etc). Choosing the appropriate journal (Sources, Information, Instructions to authors, peer review system, journal evaluation)

MICROBIAL TECHNOLOGY

Course Code: BTE4104 **Credit Units: 02**

Course Objective:
An introduction to microorganisms, their morphology, reproduction, cultivation, metabolism, genetics, ecology of microorganisms and their relationships to health and environment

Course Contents:

Module I
General concept of Microbial biotechnology, Concept of pure culture, Theory and practice of sterilization; isolation of industrially important microorganisms

Module II
Microbial Physiology and Metabolic diversity Nutritional requirements of major groups of microbes, nutritional uptake; transport across the membranes and cell wall; Growth curve and growth parameters, measurement of growth (biomass, turbidity, dry weight, protein content); environmental factors affecting microbial growth, Phototrophy, chemolithotrophy, anaerobic way of life, Microbial fermentation.

Module III
Industrial Microbiology : Principles of exploitation of microorganisms, primary and secondary metabolism, microbes in the production of: Antibiotics: Penicillin, streptomycin; Enzymes: proteases, amylases, Organic acids: Citric acid, acetic acid; Vitamins: Vit B12, B2; Amino acids: Glutamic acid, Lysine; Alkaloids; Alcohol, beer, wine, sake; Polysaccharides; microbial transformation of steroids.

Module IV
Food Microbiology: Food and dairy products (fermented milks, cheese, bread and yogurt), Mushroom cultivation, SCP, their uses and contamination; preservation and spoilage of fruits vegetables, meat and poultry products.

Module V
Bioremediation and Biodegradation: Microbial degradation of natural substances (cellulose, xylan, lignin, chitin and keratin), Microbial degradation of xenobiotics; Biodeterioration: microbial deterioration of paper, textile, wood, paint; Bioremediation of heavy metals; Microbes in sugar, leather, paper and pulp industry; Biomagnification.
Agricultural microbiology: Role of microbes in biogeochemical cycling, role of microorgamisms in crop improvement, Biofertilizers and biopesticides, Biopolymers and bioplastics.

Module V
Microbiology of waste disposal: Microbes in solid waste and solid waste management; Sewage treatment systems (primary, secondary, tertiary and disinfection); Disinfection of potable water supplies; Indicators organism for water safety; Microbial assessment of water quality.

BIOSTATISTICS

Course Code: BTE4105 **Credit Units: 02**

Course Objective:
The course aims to develop competency and expertise in the application of statistical methods applied to biological data obtained in experimental techniques.

Course Contents:
Module I: Descriptive statistics
Measures of Central Tendency (Mean, Median, Mode), Measures of dispersion (Range, Mean Deviation, Standard Deviation, Quartile Deviation), combined mean and variance, covariance, Graphs (Bar Chart, Pie Chart, Box Plot, Histogram, Ogive, scatter plot)

Module II
Concepts of Probability (Addition and Multiplication Theorem) Bayes theorem, Binomial, Poisson and Normal distribution. Correlation and linear regression, method of least squares. Sampling theory (Probablity and non probability)

Module III: Inferential statistics
Formulation of Hypothesis (One-tailed & Two-tailed), Type I and Type II errors, power of a test, Significance of a test, P-value testing, Hypothesis testing (students T-test, F-test, Chi-square test). Analysis of variance (ANOVA)

Module IV
Applications of statistical methods using statistical software SPSS or Excel

BIOCHEMISTRY AND METABOLIC REGULATION LAB

Course Code: BTE4106 **Credit Units: 01**

Course Contents:

Module I: Solutions and buffers
Preparation of molar, normal and % (w/v) solutions. Calibration of pH meter and preparation of buffers of different pH and molar strength.

Module II: Carbohydrates
Extraction and estimation of carbohydrates from given plant/animal materials: determination of total sugars by Anthrone method
Separation of sugars by thin layer chromatography

Module III: Proteins
Extraction of total proteins by TCA precipitation; Estimation of proteins by Lowery and Bradford Methods; Elctrophoretic (PAGE and SDS-PAGE) separation of isolated proteins

Module IV: Lipids
Extraction of total lipids by Folch's method; estimation of phospholipids and glycolipids; thin layer chromatographic separation of lipids

Module V: Nucleic Acid
Extraction of DNA from germinating seeds or other plant tissues; quantitative estimation of nucleic acid by diphenylamine (DPA) method; quantitative estimation of RNA by Orcinol method; characterization of isolated nucleic acid by agarose gel electrophoresis.

Examination Scheme:

GENETICS AND MOLECULAR BIOLOGY LAB

Course Code: BTE4107 **Credit Units: 02**

Course Contents:

- To make squash preparations of pre-treated metaphase chromosomes, and PMCs to view diplotene, diakinesis, metaphase I and anaphase I
- To study through photographs normal and deviant cytogenetic mechanisms
- Study of Mendel's laws, and deviations from Mendelian ratios using seed samples in the ratios of 9:7, 9:4:3, 13:3, 15:1, 12:3:1. Use Chi-Square Test for Testing the ratios
- Isolation of chloroplasts by sucrose gradient. Photographs of Restriction site variation of chloroplast DNA
- Isolation and purification of total plant and animal genomic DNA
- Determine quality and quantity of the isolated DNA
- Isolation of bacterial and plasmid DNA
- Restriction digestion profile through agarose gel electrophoresis.

MICROBIAL TECHNOLOGY LAB

Course Code: BTE4108 **Credit Units: 01**

Course Contents:

Module I
Isolation and enumeration of microorganisms from rhizosphere, Staining techniques: Simple staining, differential Gram staining, endospore staining, lactophenol cotton blue staining for fungi

Module II
Growth curve measurement of bacterial population by turbidometry

Module III
Water microbiology- presumptive, confirmed and complete test for water potability.

Module IV
Antibiotic drug sensivity by Kirby-Baurer method and Broth-Dilution method,
Isolation of antibiotic producing microorganisms and determination of antimicrobial activity of isolates.

Module V
Preparation of sauerkraut, methylene blue reductase test, microbial analysis of food products.

ANIMAL BIOTECHNOLOGY

Course Code: BTE4111 **Credit Units: 02**

Course Objective:
To introduce significance of animal tissue culture and transgenesis.

Course Contents:

Module I: Animal Cell and Tissue Culture: Principles and Applications
Types of Media, Types of Cell Culture-Primary and Secondary, Cell Transformation, Cryopreservation, Contamination.

Module II: Transgenesis
Principles and Applications of Gene Transfer Technology Methods of Gene Transfer, Vectors: SV-40, Retroviral Vector, Adenoviral Vector, Adeno-associated viral vector, Vaccinia Virus vector, Methods for Gene Delivery: Chemical Method, Physical Method. Screening and selection of Transfected cells.

Module III: Mouse as A Model for Transgenesis
Transgenic Mouse as a model to study Human Diseases.Strategies for production of Genetically Altered Mice, Transgenic Animals, Animals as Bioreactors.

Module IV: Animal Cloning and *in vitro* Fertilization
Cloning of Animal, *in vitro* fertilization and ethical issues.

PLANT CELL, TISSUE & ORGAN CULTURE

Course Code: BTE4112 **Credit Units: 02**

Course Objective:
The objective of this course is to acquaint the students with technological aspects of plant tissue culture which have direct applications in agriculture, crop improvement and industrial processes.

Course Contents:

Module I
Introduction and potential application of plant cell, tissue and organ culture techniques. Common pathways of plant regeneration and organogenesis.Organ culture, anther and pollen culture. Ovary, ovule and embryo culture (direct and indirect embryogenesis).Callus suspension culture. Protoplast, isolation, culture and fusion.Suspension cultures.Production of hybrids and cybrids.

Module II
Plant genetic transformation (Direct and indirect methods).Regeneration methodologies and recovery of transgenics.

Module III
Somaclonal and Gametoclonal Variations. Induction & Utilization of Somatic Variants; somaclonal variation, its genetic basis and application in crop improvement

Module IV
Types of plant cell reactors. Comparison of reactor performances.Novel design concepts.Elicitation and immobilization techniques.Reactors for production of secondary metabolites, peptide hormones, antigens and therapeutic molecules. Cell lines (BY2) and their development and uses. Artificial seeds and their automated production

Module V
Germplasm Preservation (Short and long term).Ex situ conservation.

ANIMAL BIOTECHNOLOGY LAB

Course Code: BTE4113 **Credit Units: 01**

Course Contents:

1) Media Preparation and sterilization.

2) Cryopreservation of animal cells.

3) Thawing of frozen cell to initiate new culture.

4) Prepration of growth curve for
   i) Suspension cells
   ii) Adherent Cells

5) Drug toxicity testing and therapeutic index in
   i) Primary cells
   ii) Tumor cells.

6) Transient over-expression of a gene in
   i) Adherent cells
   ii) Suspension cells

Syllabus – Second Semester

RECOMBINANT DNA TECHNOLOGY

Course Code: BTE4201 **Credit Units: 02**

Course Objective:
A complete understanding of molecular techniques like DNA sequencing, restriction mapping, PCR, cloning and expression of genes can be obtained through this course.

Course Contents:
Module I: Concept of gene
Concept of gene, prokaryotic and eukaryotic control elements and their analysis, random, Restriction enzymes, DNA polymerase, DNA modifying enzymes and their use.

Module II: Plasmids, M13 Single stranded DNA Phage, bacteriophage lambda, lysogeny and lytic cycle and their genetic switches. DNA cloning and expression vectors – plasmids, lambda, insertional and replacement vectors, cosmids, YAC, BAC, PAC.

Module III: Construction of genomic and cDNA library .Genomic DNA, mRNA isolation, cDNA synthesis. Methods for identification of recombinant clones.

Module IV:DNA sequencing, genome mapping and sequencing, next generation sequencing, polymerase chain reaction (PCR) and its application, bioinformatics and database analysis.

Module V: Analysis of gene expression: Northern blotting, RT – PCR, Real time (Q) PCR and microarray analysis. Isolation of recombinant DNA clones, gene transfection / transformation in cells and tissues, knock out / in mice, animal cloning and their applications. Genome – wide high through – put analysis and its application.

Module VI : Transposon mediated and site – directed mutagenesis and its applications, Expression of recombinant proteins in *E.coli* and its applications, RNA interference, applications in disease diagnosis, gene therapy, vaccine production, transgenic plants and animals.

BIOINFORMATICS & COMPUTATIONAL BIOLOGY

Course code: BTE4202 **Credit Units: 02**

Course Objective:
This course will enable the students to achieve skills in Bioinformatics & Computational Biology that are essential for application in Biotechnology.

Course Contents:
Module I: Introduction to Bioinformatics
Overview of Bioinformatics and computational biology. Importance of databases - EMBL – NCBI nucleic acid sequence databases - protein sequence databases (SwissProt) - structure databases (PDB) - bibliographic databases

Module II: Sequence Alignment Methods
Sequence analysis of biological data - methods of alignment - methods for optimal alignments; using gap penalties and scoring matrices- multiple sequence alignment – introduction - tools for MSA (MUSCLE, T-coffee) - application of multiple sequence alignment. Similarity Searching Tools: BLAST and FASTA, Theory and Algorithms, variants of BLAST and FASTA, PSI-BLAST and PHI BLAST, Statistical Significance.

Module III: Molecular Phylogenetics and Methods
The concept of evolutionary tree, terminology of phylogenetics, introduction to evolutionary models, Types of phylogenetic trees (rooted vs. unrooted trees).Phylogenetic analysis algorithms: UPGMA, Neighbors-Relation, Neighbor-Joining, maximum Parsimony, maximum likelihood. Tree evaluation methods: Bootstrapping,Randomized and jack-knifing methods, Phylogenetic analysis software: PHYLIP, MEGA, and PhyML.

Module IV: Predictive methods using DNA and protein sequences
Concepts of motif, pattern and profile, Gene Identification methods, Gene predictions strategies – Prokarytotic and Eukaryotic, Identification and characterization of proteins, Protein structure prediction methods: Secondary and tertiary approaches.

Module V: Introduction to Chemoinformatics, Molecular modelling& Drug designing
Chemical similarity search methods, Designing focused chemical libraries, Comparative protein modelling, Molecular docking and virtual high-throughput screening, Search algorithms, Scoring methods, Challenges in Molecular docking, Introduction of receptor flexibility through multiple receptor conformations (MRC docking), Hit-to-lead optimization, Introductory concept of Activity Cliffs.

BIOCHEMICAL ENGINEERING

Course Code:BTE4203 **Credit Units: 02**

Course Objective:
The course material on the types of bioreactor, mass and energy balance, aeration and agitation, scale-up principles etc. may help the students to understand the various principles involved in instrumentation and control and scale-up of bioprocess.

Course Contents:

Module I
Concepts of Mass Balance and Energy Balance, Kinetics of microbial growth and Batch Fermentation processes and Maintenance coefficient. Fed batch fermentation.

Module II
Design considerations for maintaining sterility of the fermentation medium for various temperature-time profiles for Batch and Continuous Processes, Residence Time Concept, Design Calculation.

Module III
Aeration and Agitation in Bioreactors: Mass Transfer Theories, Bubble aeration and Mechanical agitation, Correlation between Mass transfer coefficients and Operating variables.

Module IV
Comparison ofbatch and continuous fermentation, Cell recycle, Two stage continuous Culture . Principles of scale up, Criteria of scale up

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

ENVIRONMENTAL BIOTECHNOLOGY

Course Code:BTE4204 **Credit Units: 02**

COURSE OBJECTIVE

To introduce the students to regenerate clean environment using biotechnology as the key tool and also provide them the insight for various eco-friendly approaches and technologies along with the concept of sustainable development

COURSE CONTENTS

Module-I:

Greenhouse effect, Global Warming, Global Ozone Problem, Acid Rain, Eutrophication and Biomagnification

Module-II:

Renewable and Non-Renewable energy resources
Clean fuel technology and Biofuels- Bioethanol, Biogas, Biodiesel, Algal fuels.

Module-III:

Waste Water Engineering: Treatment of municipal waste water and industrial effluents with special focus on biological and advanced water treatments
Solid Waste Management

Module-IV:

Bioremediation and Biodegradation ofmajor environmental pollutants- release of genetically engineered microbes in environment.
Biomineralisation- Use of microbial technology for mining of metals from ores

Module-V:

Biofertilizers, Biopesticides and IPM, Vermicomposting
Bioassessment of environmental quality- Bioindicators and Biosensors

Module-VI

EIA and Environmental Audit
Related case studies at national and global level

Examination Scheme

Components	CT	Attendance	Assignment/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

IPR AND BIOETHICS

Course Code:BTE4205 **Credit Units: 02**

Course Objective:
The objectives of the course are to explain the fundamental principles of IPR and issues related to IP and examine information policy issues from different perspectives. Students will study and assess policy groups, intellectual property rights, access to information and research policy issues that usually include plant, animal and microbial genetic engineering products.

Course Contents:

Module I: Introduction
Introduction – Invention and Creativity – Intellectual Property (IP) – Importance – Protection of IPR – Basic types of property and Objectives of Intellectual Property Rights, origin and evolution of IPR, tangible and intangible property; concept and classification of intellectual property: Copyrights and related rights, Patent, Industrial Design, Trademarks and Geographical indications, Rights of traditional Knowledge and Protection of Plant varieties

Module II: IPR
International convention relating to Intellectual Property – Establishment of WIPO – Mission and Activities – History – General Agreement on Trade and Tariff (GATT) – TRIPS Agreement. Indian Position Vs WTO and Strategies – Indian IPR legislations – commitments to WTO-Patent Ordinance and the Bill – Draft of a national Intellectual Property Policy – Present against unfair competition.

Module III: Patent
Basic criterion for patentability, patentable subjects, patentable inventions, patent acquisition, infringement of patent, discovery Vs invention, product patenting Vs process patenting, special issue in biotechnology patent, Patent laws in Indian and international perspective, Patent Application procedure, patent Claim and specifications, Case study: Basmati case, Neem controversy, Turmeric Case

Module IV: Biosafety
Definition and requirement; biosafety in relation to human health, environment, transgenic research and applications, biosafety laws, guidelines and conventions, biosafety regulation: principles and practices in microbial and biomedical labs, guidelines for research involving DNA molecule ; Regulation bodies at National and International level

Module V Bioethics
Legal and socioeco'nomic impact of the products and techniques in Biotechnology, Bioethics in plant, animal and microbial genetic engineering, Ethical issues in healthcare, Biopiracy and ethical conflicts

Examination Scheme:

MOLECULAR CELL BIOLOGY

Course Code:BTE4206 **Credit Units: 03**

Course Objective:
The object of the present course is to develop basic knowledge and skills in cell and molecular biology and to understand the structure and function of the cellular and sub cellular components of cells and tissues with the help of recent techniques. This course will help students to get an understanding of cell function at the molecular level including the fundamentals of DNA They will become aware of the complexity and harmony of the cell. Applications of cellular and molecular biology in Biotechnology will also be presented.

Course Contents:
Module-I: Membrane structure : Chemical and physical properties of cell membranes and their major components, significance of these properties to membrane structure, integral and peripheral membrane proteins, biosynthesis of membrane and secreted proteins.
Structure of nuclear envelope, nuclear pore, complex. transport across nuclear envelope; regulation of nuclear import

Module-II: Cell Trafficking : Targeting proteins to endoplasmic reticulum, signal recognition parcticle, signal recognition particle receptor, protein folding and processing in ER protein export from ER; Protein sorting and export from Golgi Apparatus; SNARE hypothesis; Protein import into Mitochondria, mitochondrial genome; Import and sorting of chloroplast protein.
Targeting of proteins to membranes, mechanisms for transport of small molecules across the membrane, including simple diffusion, facilitative diffusion, primary and secondary active transport, action of ionophores ; transport across nuclear envelope; regulation of nuclear import

Module-III: Cell division and regulation of cell cycle : control of the cell cycle and the proteins involved; know the role of the cyclins and cyclin-dependent kinases, cell cycle checkpoints, methods for synchronizing the cell cycle in cell populations.

Module-IV: Intracellular Signaling - Modes of cell signaling, steroid hormone receptors, peptide hormones and growth factor, plant hormones, G-protein coupled receptors; receptor –protein tyrosine kinase , c- AMP pathway of signal transduction ; c GMP, phospholipids and calcium ions , Ras, Raf , MAP kinase pathway , JAK –STAT pathway , Apoptosis –role of caspases.

Module-V: Cancer Biology
Types of cancer; development of cancer**,** cells; Oncogenes, protooncogenes , function of oncogene products , tumor suppressor genes , function of tumor suppression gene products, role of oncogene and tumor suppressor gene in development, molecular diagnosis of cancer.

RECOMBINANT DNA TECHNOLOGY LAB

Course Code:BTE4207 **Credit Units: 02**

- Preparation and transformation of competent cells
- Study of restriction digestion.
- Study of ligation.
- Study of southern blotting.
- Study of Western blotting
- Study of RFLP
- Study of PCR.

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

BIOINFORMATICS & COMPUTATIONAL BIOLOGY LAB

Course Code: BTE4208 **Credit Units: 02**

Course Contents:

Module I: Databases and file formats

Biological databases: NCBI, EMBL, DDBJ, PIR, PDB, SwissProt, KEGG, UNIgene, Ensembl, STRING, GEO. Sequence file formats: GenBank, FASTA, EMBL, PDB format

Module II: Sequence Analysis

DotPlot Analysis: DOTPLOT, DOTTER.DOTMATCHER.
Pairwise Sequence Alignment programs: LALIGN, EMBOSS NEEDLE, EMBOSS Water.
Multiple Sequence Alignment programs: Clustalw, Cobalt, Muscle, T-Coffee.
Similarity Searching: BLAST, Variants of Blast.

Module III: Phylogenetic Analysis

Phylogenetic analysis softwares: Phylip, Mega.

Module IV: Predictive softwares

Primer Designing: PRIMER3
Gene Identification Programs: Genscan, ORF finder. Fgenesh, Glimmer
Protein Identification and characterization: Protparam , Peptide cutter.
Motif and Patterns program: Prosite, InterProScan, Pfam.

Module V: Proteins and Comparative Modeling

Modellingsoftwares: Swiss Model workspace, Modeller,
Model Evaluation: PRocheck.
Docking Software: Hex

Module VI: Network Analysis

Network Anaysis Software: Cytoscape, Complex pathway Simulator.

Examination Scheme:

ENVIRONMENTAL BIOTECHNOLOGY LAB

Course Code: BTE4209 **Credit Units: 01**

Course Objective:
The present course aims to develop the practical understanding of use of various processes and microbes in environmental monitoring and clean up. Hence will provide an insight to envisage the different environmental problems and their solutions

Course Contents:

Module I
Foliar symptomological study of air pollution- chlorosis and necrosis

Module II
Physical and Chemical analysis of water and soil.
BOD, COD, DO determination in water samples

Module III
Isolation and characterization of microbes in contaminated soil and water
And to determine their bioremediation efficiency.

Module IV
Vermicomposting

Module V
Estimation and comparison of pigment content and sugar content in leaves due to air pollution with control.

Examination Scheme:

IA (30)			EE (70)			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

IMMUNOLOGY

Course Code: BTE4211 **Credit Units: 02**

Course Objectives:
Aim of this course is to provide in-depth information of immune-system and its implication for health and diseases. Knowledge about the principles and applications of immune-assay to evaluate the immune-status.

Course Contents:
Module I
Introduction:
Overview of immune system: Types of immunity clonal nature of immune response; Organization and structure of lymphoid organs; Hematopoiesis and differentiation; Cells of the Immune System

Module II
Antigen and Antibody:
Antigens: Types, Responses and Characteristics, Immunoglobulin: structure, function, antibody diversity and its mechanism, Therapeutic applications of antibodies.

Module III
Mechanism of Immune-response:
Complement system, Major histocompatibility complex, Lymphocyte Biology: Development, differentiation and activation of lymphocytes, Cytokines and Cell Signaling, Homeostatic Regulation of Immune Responses.

Module IV
Immune-system in Health and Disease:
Transplantation Immunology, Tumor Immunology, Infection and Infectious Disease, Hypersensitivity,Immune System Disorders; Immunotherapy, Vaccines

Module V
Immunoassays:
Methods of antibody production and their use in Immunoassays; Immunodiffusion, Immunoelectrophoresis and Immunohistochemistry; ELISA,-principle, types and applications; Flow cytometry

TERM PAPER

Course Code: BTE4231 **Credit Units: 01**

A term (or research) paper is primarily a record of intelligent reading in several sources on a particular subject. The students will choose the topic at the beginning of the session in consultation with the faculty assigned. The progress of the paper will be monitored regularly by the faculty. At the end of the semester the detailed paper on the topic will be submitted to the faculty assigned. The evaluation will be done by Board of examiners comprising of the faculties.

GUIDELINES FOR TERM PAPER

The procedure for writing a term paper may consist of the following steps:

1. Choosing a subject
2. Finding sources of materials
3. Collecting the notes
4. Outlining the paper
5. Writing the first draft
6. Editing & preparing the final paper

1. Choosing a Subject

The subject chosen should not be too general.

2. Finding Sources of materials

a) The material sources should be not more than 10 years old unless the nature of the paper is such that it involves examining older writings from a historical point of view.
b) Begin by making a list of subject-headings under which you might expect the subject to be listed.
c) The sources could be books and magazine articles, news stories, periodicals, scientific journals etc.

3. Collecting the notes

Skim through sources, locating the useful material, then make good notes of it, including quotes and information for footnotes.

a) Get facts, not just opinions. Compare the facts with author's conclusion.
b) In research studies, notice the methods and procedures, results & conclusions.
c) Check cross references.

4. Outlining the paper

a) Review notes to find main sub-divisions of the subject.
b) Sort the collected material again under each main division to find sub-sections for outline so that it begins to look more coherent and takes on a definite structure. If it does not, try going back and sorting again for main divisions, to see if another general pattern is possible.

5. Writing the first draft

Write the paper around the outline, being sure that you indicate in the first part of the paper what its purpose is. You may follow the following:

a) statement of purpose
b) main body of the paper
c) statement of summary and conclusion

Avoid short, bumpy sentences and long straggling sentences with more than one main idea.

6. Editing & preparing the final Paper

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

a) Before writing a term paper, you should ensure you have a question which you attempt to answer in your paper. This question should be kept in mind throughout the paper. Include only information/ details/ analyses of relevance to the question at hand. Sometimes, the relevance of a particular section may be clear to you but not to your readers. To avoid this, ensure you briefly explain the relevance of every section.
b) Read the paper to ensure that the language is not awkward, and that it "flows" properly.
c) Check for proper spelling, phrasing and sentence construction.
d) Check for proper form on footnotes, quotes, and punctuation.
e) Check to see that quotations serve one of the following purposes:
   (i) Show evidence of what an author has said.
   (ii) Avoid misrepresentation through restatement.
   (iii) Save unnecessary writing when ideas have been well expressed by the original author.
f) Check for proper form on tables and graphs. Be certain that any table or graph is self-explanatory.

Term papers should be composed of the following sections:
1. Title page
2. Table of contents
3. Introduction
4. Review
5. Discussion & Conclusion
6. References
7. Appendix

Generally, the introduction, discussion, conclusion and bibliography part should account for a third of the paper and the review part should be two thirds of the paper.

Discussion

The discussion section either follows the results or may alternatively be integrated in the results section. The section should consist of a discussion of the results of the study focusing on the question posed in the research paper.

Conclusion

The conclusion is often thought of as the easiest part of the paper but should by no means be disregarded. There are a number of key components which should not be omitted. These include:

a) summary of question posed
b) summary of findings
c) summary of main limitations of the study at hand
d) details of possibilities for related future research

References

From the very beginning of a research project, you should be careful to note all details of articles gathered.

The bibliography should contain ALL references included in the paper. References not included in the text in any form should NOT be included in the bibliography.

The key to a good bibliography is consistency. Choose a particular convention and stick to this.

Conventions

Syllabus – Third Semester

ENZYME TECHNOLOGY

Course Code: BTE4301 **Credit Unit: 02**

Course Objective

The course objective covers an understanding of the principles and application of protein, secondary metabolites and enzyme biochemistry applicable to industrial bioprocesses, process design, and operation strategies of various enzyme reactors.

Course Contents:

Module I: Introduction to Enzymes

Structure and general properties of enzymes; Mechanism of Enzyme Action; Concept of active site and Energetics of enzyme-substrate complex formation, Activation energy; Specificity of enzyme action; Cofactors; Monomeric and Oligomeric enzymes.

Module II: Kinetics of single-substrate enzyme catalysed reactions

Derivation and significance of Michaelis-Menten rate expression; Linear plots, King-Altman's method; Turnover number; Effect of temperature and pH on enzyme activity and stability; Inhibition kinetics.

Module III: Kinetics of Multisubstrate enzyme catalysed reactions

Multisubstrate enzyme kinetics: Ping-pong and Ordered (Sequential and Random) mechanisms; Alberty equation; Co-operativity; Sigmoidal kinetics; Allosteric enzymes; Isozyme and Multienzyme complex.

Module IV: Enzyme Immobilization and Bioreactors

Techniques for enzyme Immobilization-adsorption, matrix entrapment, encapsulation, cross-linking, covalent binding; Characteristics of Immobilized systems; Design of Enzyme Reactors-Packed-bed, Fluidized-bed, Membrane reactors; CSTRs.

Module V: Applications of enzymes and future trends

Enzymes applications-Industrial, Analytical, Medicaland Environmental; Enzyme based biosensors; Enzyme Inhibitors as therapeutic agents; Extremozymes, Abzymes, Ribozymes, Hybrid enzymes, Inteins.

GENOMICS AND PROTEOMICS

Course code: BTE4302 **Credit Units: 02**

Course Objectives:
The course covers the basic principles that underlying the structure, function, expression and evolution of diverse genomes and proteomes, by assessing contents of genomic /proteomic characterization and bioinformatics analysis. This course introduces a comprehensive overview of analytical platforms, computational tools; experimental design, analysis methods and databases intended to study DNA/protein sequences, characterization, gene expression and genome evolution, remodeling as well as the implications of this research.

Course Contents:
Module I - Introduction & Structural Genomics
Concepts of Genes and Genomes, Genome size, Sequence complexity, genome organization in diverse organisms (eukaryotes, prokaryotes, virus), and organelle genomes, genome evolution.
Structural features of the genome - Organization of single-copy sequences, Repetitive sequences (Tandem repeats, Copy Number variations, duplications, Transposable elements)

Module II – Resources of Genome Study
Structuring genomic resources – Subdividing genomes, DNA markers, Genetic and Physical mapping, Mapping populations. Genome Sequencing (eukaryotic and prokaryotic) – methods (chemical, chain termination) and strategies (WGS, H-WGS, de novo), Human genome project (findings and impact).Next Generation Sequencing technologies (Pyrosequencing, Virtual terminator sequencing, Ion torrent, nanopore). Genome finishing – Annotation of genome (structural and functional- de novo, homology based).

Module III – Comparative and Functional Genomics
Overview of sequence analysis – methods, databases, genome browsers (NCBI, UCSC, ENSEMBL).Homologs, paralogs, orthologs, synteny, colinearity and gene displacement.Implications of comparative genomics – molecular evolution and multigene family evolution. Forward and reverse genetics (Tools and Methods – mutagenesis, knock outs/ knock ins, RNAi, morpholino), genome wide expression analysis. Concept of Epigenomics, Concepts of genome evolution (finding signatures of function, remodeling and applications).

Module IV – Transcriptomics and Gene Expression
mRNA/ protein expression profiles, Transcriptomes (tools and resources), Gene expression profiling / gene regulation (traditional to high throughput techniques- Northern, Subtractive hybridization, SAGE, Microarray).

Module V – Proteomics: Fundamentals and Interactomics
Proteomics Techniques (sequence based and hybridization based techniques - 2D Gel Electrophoresis, HPLC, Mass Spectrometry, Protein/ peptide arrays), Quantitative and Qualitative proteomics, Mining Proteomes, Computational approaches for studying proteomes.
Protein Mapping (expression and interaction mapping) techniques (Two hybrid methods and variations, Phage display, Co-IP, Mass Spectrometry, labeled and unlabeled tagging), Data Analysis using bioinformatics tools, Protein – (Protein/ligand) interaction networks.

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

Module VI – Proteomics: Structure-omics and Cellular Proteomics

High throughput proteome analysis (2D GE & MS, Microarray & MS; SAGE & Microarray), 3 D structure determination (X-ray and NMR, PDB, Pfam, Modeller, SMART), structure to functional analysis (Fold comparison, Threadding, Functional sites, homology and ab initio modeling)

High throughput cloning, Activity and functional characterization, Post-translational modifications, Concepts of protein engineering, Proteomic workflows.

STRUCTURAL BIOLOGY

Course Code: BTE4303 **Credit Units: 02**

Course Objective:
The course aims to provide an understanding of the canonical and non-canonical structure of the nucleic acids and the detail structure of proteins, enzymes etc. Detailed structural analysis will also give an idea about the mode of recognition of different biomolecules, nature of interaction and their role in therapy and nanotechnology.

Course Contents:
Module I: Canonical and Non-canonical Structure of Nucleic acids:
Canonical Structure: Structure of Nucleic acids, Detail structure of Double-Stranded DNA, Major and Minor groove, Chemical differences in DNA and RNA, Wobble base-pairing, DNA-drug interaction.
Non-canonical Structures: DNA polymorphism (A-DNA, B-DNA, Z-DNA), Parallel DNA, base flipping. Repeat elements (inverted repeat, mirror repeat and direct repeat) and cruciform structures, Intramolecular and Intermolecular Triplex DNA and its role in therapeutics, Intramolecular and intermolecular four-stranded DNA (G-quadruplex and i-motif), Telomeric DNAs of different eukaryotic species, role of telomere in cancer and aging, G-quadruplex as a therapeutic target, G-wire, role of G-quadruplex and i-motif in nanotechnology.

Module II: Protein structure and function: Primary structure of protein, Ramachandran plot, secondary structure of protein (alpha helix, 3_{10} helix, π-helix,β-sheet, loops, turns), sequence and structural motifs (helix-turn-helix, helix-loop-helix, leucine zipper, Greek key motif etc.), tertiary and quaternary structure of proteins.

Module III: Effect of physical and chemical parameters on structure and stability of Nucleic acids and proteins: Effect of cations, pH, temperature and chemical agents on the structure and stability of nucleic acids and protein, concept of thermodynamic parameters (free energy, enthalpy and entropy).

Module IV: BiomolecularInteractions:DNA-protein interaction, DNA-drug interactions, protein-protein interactions (hemoglobin, myoglobin, G-protein coupled receptors).

Module V: Characterization of Nucleic Acid Structure and Protein by biophysical and biochemical approach: Structural analysis by UV-VIS spectroscopy, Circular Dichroism, NMR and X-ray crystallography, thermal stability of Nucleic acid structure and protein by thermal denaturation curves, Principles of Isothermal Calorimetry (ITC), Differential Scanning calorimetry (DSC), Fluorescence Spectroscopy.

DOWNSTREAM PROCESSING & FERMENTATON TECHNOLOGY

Course Code: BTE4304 **Credit Unit: 02**

Course Objective:
The syllabus will help the students to characterize the Bioproducts of biotechnological importance and to get expertise in their downstream processing.

Course Contents:
Module I: Fermentation Technology-An Overview
Development and overview of fermentation processes, strain development, media design and optimization, commercial media for fermentation

Module II: Bioproduct Production
Production of Ethanol, Antibiotics, Recombinant products,Citric acid, Industrial enzymes

Module III: Downstream Processing-An Overview
Importance of downstream processing in biotechnology; characteristics of bio-products and fermentation broth

Module IV: **BioproductIsolation**
Cell disruption; Filtration; Centrifugation; Precipitation

Module V: Purification
Membrane Based Separation; Chromatographic methods of separation based on size, charge and biological affinity, 1D, 2D gel electrophoresis

Module VI: Polishing
Crystallization; Drying and Formulations; Case studies

ENZYME TECHNOLOGY LAB

Course Code: BTE4305 **Credit Units: 02**

Course Contents:

Module I:
Isolation of enzymes from various sources

Module II:
Determination of specific activity of lipase, phosphatase, cellulase, protease and amylase

Module III:
Determination of Temperature and pH optima of an enzyme catalyzed reaction

Module IV:
Determination of Michaelis-Menten constant (K_m) and Maximum Velocity (V_{max}) of an enzyme catalyzed reaction using Linear plot method; Turnover number; catalytic efficiency

Module V:
Effect of various additives on enzyme activity

Module VI:
Enzyme immobilization and its effect on activity

Examination Scheme:

GENOMICS AND PROTEOMICS LAB

Course Code: BTE4306 **Credit Units: 02**

Course Objectives:
The course will familiarize students with the tools and principles of contemporary genomics and proteomics. Bioinformatics resources relevant to genome / proteome investigations will be provided for a sound working knowledge of current genomics and proteomics technology and approaches.

Course Contents:
Module I – **An Introduction to Genome Browsers –**
NCBI and UCSC – General features; Important Sequence formats – Raw, Fasta and EMBL; Sequence retrieval methods – Whole Genomes (command line and browser), Gene or position search (browser)

Module II - Sequence annotation
Restriction site annotation; Repeat Annotation of sequence Repeat Masker; ORF annotation – using ORF finder; Gene Prediction – using Gene Scan and Glimmer; Primer designing using Primer 3

Module III – Homology Search, Sequence conservation and Phylogeny
Homology Search – BLAST and its variants, BLAT; Multiple Sequence Alignment – Clustal W and ClustalX; Phylogeny and molecular evolution – MEGA

Module IV: Integration of bioinformatics workflow
NCBI Genome biology workbench

Module V: Proteome analysis
EXPASY Server, RCSB Protein data banks, BLASTp
Primary structure analysis tools (Translate and reverse translate, Codon Usage, FindPept, FindMOD, pI/Mw computing, Multident, ProtParam, Peptide cutter, Mascot)
Secondary structure analysis tools (hydropathy plots, motif searches, conserved domains, PROSITE, InterPro Scan, PfamHMM, SMART, threading); Tertiary structure analysis tools (JMOL/ Pymol / Rasmol), MODELLER; Phylogenetic profiling

STRUCTURAL BIOLOGY LAB

Course Code: BTE4307 **Credit Units: 01**

Course Contents:

- Calculation of extinction coefficient of olgonucleotides either manually or using the software.
- Quantification of genomic DNA, oligonucleotides and proteins by UV-VIS Spectroscopy.
- Effect of cations (monovalent or divalent) and pH on genomic DNA, oligonucleotides and proteins by UV-VIS Spectroscopy.
- Study of DNA-ligand (spermine, ethidium bromide, proflavin etc.) interactions using UV-VIS spectroscopy and PAGE.
- Electrophoretic shift assays to check molecularity of the structures with short designed synthetic nucleotide sequences.
- Protein Folding using SDS-PAGE.
- Effect of physical and chemical factors on protein structure.

FERMENTATION BIOTECHNOLOGY & DOWNSTREAM PROCESSING LAB

Course Code: BTE4308 **Credit Unit: 02**

Fermentation Biotechnology

Module I:
Isolation of industrially important microorganisms for microbial processes

Module II:
Determination of growth curve of supplied microorganisms and determination of substrate degradation profile and computation of specific growth rate and growth yield form the data obtained

Module III:
Comparative studies of ethanol production using different substrates; Production of enzyme

Downstream Processing

Module I:
Product Isolation

Module II:
Protein precipitation and recovery

Module III:
Membrane-based separation

Module IV:
Ion exchange chromatography

Module V:
Gel Permeation chromatography

Module VI:
Poly-acrylamide Gel Electrophoresis (PAGE)

INDUSTRIAL MANAGEMENT

Course Code: BTE4309 **Credit Unit: 03**

Course Objective:
The course is designed to provide students the ability to understand Industrial Business, it's markets and relevant industrial management strategies. The course will equip students the knowledge to cope up changing environment due the advent of technology & other influences. It will also cover the Safety laws & Acts required in managing industrial business. Also it will make students to understand the nature and role of Industrial business, characteristics of business markets, implementation of relevant industrial strategies and developing comprehensive insight for Entrepreneurship Development.

Course Contents:

Module I: Introduction to Industrial Management
Introduction to the Concept of industrial Management, Planning and decision making in industrial management process, Application and scope of Industrial Management, Understanding Industrial Market need, Want & demand management, Industrial Relations, Role & Responsibility of Industrial Manager.

Module II: Understanding Safety &Legal Framework in Industrial management
Factory Act, ESI Act, Environmental Act, Workmentcomperation Act, Need for industrial safety. Role of Government in industrial safety, Safety organization - safety committee - safety education and training, Advantages of adopting safety laws.

Module III: Understanding Industrial Markets, Goods & Customers and Industrial Buying Behavior: Introduction to the industrial goods, Types of industrial goods, Identifying sources for resource suppliers, Industrial customers, Industrial demand, purchasing practices of Industrial customers, Concept of business buying behavior.

Module IV: Introduction to Entrepreneurial Development
Introduction to the concept of Entrepreneurship & characteristics of entrepreneurship, Entrepreneurial process Stages in Entrepreneurial process, Entrepreneurial competencies, Entrepreneurship in India, Barriers in Entrepreneurship, Types of ownership suitable for business. Woman Entrepreneur, Challenges faced by women entrepreneurs.

Examination Scheme:

IMMUNOTECHNOLOGY

Course Code: BTE4310 **Credit Units: 03**

Course Objective:
Aim of this course is to provide in-depth information of immune-system and its implication for health and diseases. Knowledge about the principles and applications of immune-assay to evaluate the immune-status

Course Contents:
Module-I
Introduction to Immunotechnology
Antigen and Antibody: Tools for immunodiagnostics, Kinetics of immune response, Principles of Immunization

Module II
Immunization and Antigen and Antibody
Immuno-chemistry of Antigens - immunogenicity, Antigenicity; Haptens, Toxins-Toxiods, Hapten-carrier system; Production of Polyclonal and Monoclonal Antibodies- Hybridoma Technology, Antibody interaction, affinity, cross reactivity, specificity; Immunoassays- RIA, ELISA, Western blotting, ELISPOT assay, immunofluorescence, Other applications; Antibody engineering, phase display library.

Module III
CMI and Imaging Techniques
Principle of Immunofluorescence Microscopy, Flurochromes, Staining techniques for live cell imaging and fixed cells, Flow cytometry, Lymphoproliferation, Cell Cytotoxicity, mixed lymphocyte reaction, Apoptosis, Cytokine expression, In vivo cell tracking techniques.

Module IV
Vaccine Technology
Active and Passive Immunization, Rationale for vaccine design, Kinds of vaccines live, killed, attenuated, Sub unit vaccines, Recombinant DNA vaccine, Peptide vaccines, conjugate vaccines; Role and properties of adjuvants.

Examination Scheme:

AGRI-FOOD BIOTECHNOLOGY

Course code: BTE4311 **Credit Units: 03**

Course Contents:

Module I: Introduction
Scope and importance of food industry; RDT and other technologies involved in development of food products; Concept of 'functional food'; Advances and trends, ethical issues, quality control, legislation, FDA & FPO (India), patenting processes and products, consumer acceptance scenario for GM food products and GM crops.

Module II: Techniques used in Food Industry
Sterilization, isolation, screening and strain improvement, cell harvesting and disruption, recovery and purification, production of organic acids – citric acid, lactic acid and acetic acid; Gene cloning, production of recombinant proteins e.g. chymosin

Module III: Dairy Biotechnology
Starter cultures, prebiotics, probiotics – their use as flavor enhancers and disease/ infection combats, applications in production of cheese, butter, ice-cream, yoghurt; applications in biomedical research, e.g. recombinant LABs as vaccines; Modified milk proteins.

Module IV: Microbial, Plant and Animal Biotechnology
Production of SCP (Single cell protein), production of baker's yeast, brewing industry, applications of transgenic plants in food production, transgenic fist, and transgenic poultry.

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

BIOFUELS & GREEN TECHNOLOGY

Course code: BTE4312 **Credit Units: 03**

Course Objective:
This course will acquaint the students with bioenergy resources, their properties, preparation, processing along with the details of equipments utilized for the purpose.

Course Contents:

Module I: Biomass Sources, Characteristics & Preparation: Biomass Sources and Classification
Chemical composition and properties of different biomass materials and bio-fuels – Sugar cane molasses for fermentation ethanol; Sources and processing of oils and fats for liquid fuels- Energy plantations - Preparation of woody biomass; Drying, Storage and Handling of Biomass.

Module II: Biogas Technology
Feedstock for biogas production, biodegradable organic matter, Operating parameters for biogas production, Dry and wet fermentation

Module III: Bio-Ethanol and Bio-Diesel Technology
Production of Fuel Ethanol by Fermentation of Sugars.Trans-esterification of Oils to Produce Bio-Diesel.

Module IV: Pyrolysis and Gasification of Biomass
Thermo-chemical conversion of ligno-cellulose biomass - Pyrolysis of biomass,Thermo-chemical gasification principles

Module V: Combustion of Biomass and Cogeneration Systems
Combustion of Woody Biomass, Cogeneration in Biomass Processing Industries.Use of biogases for cogeneration.

Examination Scheme:

STEM CELLS & GENE THERAPY

Course Code: BTE4313 **Credit Units: 03**

Course Objective:
The course is designed to give a broad view of mammalian stem cells, reviewing where they are found in the body, the different types and how they are cultured. The topics will cover the basic biology of these stem cells as well as bioengineering and application of these stem cells to potential treatments of human diseases.

Course Contents:

Module I
Introduction to Gene Therapy, History and evolution of Gene therapy, optimal disease targets, Failures and successes with gene therapy and future prospects

Module II: Gene Delivery
Adenoviral Vectors, Adeno-associated virus (AAV) Vectors, Non-viral Vectors and Physical Methods, Retroviral and Lentiviral Vectors, Herpes Virus Vectors & Combinatorial methods, Gene transfer methods

Module III
Innate and Acquired Immune Response to Cell and Gene Therapy, Gene Therapy and the Immune System: Genetic Immunization

Module IV
Stem Cell biology and therapy, types embryonic stem cell, Adult stem cell, Stem Cell Biology and Therapy, Embryonic Stem Cells, culture and the potential benefits of stem cell technology

Module V
Cell, Disease, and Genetic Perspectives for Gene Therapy, Cell and Gene Therapy of the Nervous System, Cancer Gene Therapy, Cell and Gene Therapy for Vascular Disorders, Bone marrow transplants, Cancer Gene Therapy, Immunotherapy, Autoimmune Diseases and the Promise of Stem Cell-Based Therapies, Stem Cells and Diabetes, Stem Cells and heart Repair

Module VI
Regulatory and Ethical Considerations of Cell and Gene Therapy, Assessing Human Stem Cell Safety, Use of Genetically Modified Stem Cells in Experimental Gene Therapies.

DRUG DESIGN & PHARMACEUTICAL BIOTECHNOLOGY

Course code: BTE4314 **Credit Units: 03**

Course Objective:
The above course will be aimed to identify targets and design drugs that could be potentially useful in the identification of the candidate drugs, which have efficacy in cell culture or animal models. The student will gain basic concepts in the specific field of Pharmaceutical Biotechnology Industry and insight into the working of a pharma industry, various classes of biotech products and the regulations governing production and marketing of pharmaceutical products.

Course Contents:

Module I: Drug targets classification, discovery & validation strategies
Introduction to drug discovery & development; Target classification: DNA, RNA, post-translational, processing enzymes, metabolic enzymes involved in nucleic acid synthesis, G-protein coupled receptors, small molecule receptors, neuropeptide receptors, ion channels proteins, ligand-gated ion channels, transporters; Genomics (new target discovery), biological activity directed and other types of screening, natural products, combinatorial chemistry; General overview of validation techniques.

Module II: Structure-based design
Physicochemical properties of drugs, metabolism, toxicity and pharmacokinetics, toxicology considerations, problems and drawbacks on drug discovery and development.
'de novo' design methodologies: indirect drug design, pharmacophore development and receptor mapping, combinatorial libraries**.** DNA vaccines, Vaccines & Monoclonal antibody based pharmaceuticals, Antibiotics, Characterization.

Module III: Basic concepts of Drug Delivery
Concepts of Bio availability, drug absorption, pharmacodynamic&Pharmacokinetic processes, Timing for optimal therapy, Drug delivery considerations for the new biotherapeutics. Basic terminologies in drug delivery and drug targeting, Drug release, Drug targeting, Doses forms, Routes of drug administration, Basic strategies for enhanced therapeutic efficacies

Module IV: Delivery of Genetic material
Basic principles of gene expression, Viral and nonviral vectors in gene delivery, Clinical applications of gene therapy and antisense therapy; Bioanalytical aspects of Recombinant proteins as pharmaceutical drugs**:** Formulation of Biotechnological Products and their role in clinical development
Nanotechnology, Use of biosensors and challenge of chronopharmacology, Microchips and controlled drug delivery, Genetically engineered cell implants in drug deliver.

Module V: Regulations
Role of FDA, ICH Guidelines, cGMP, The Regulation of Pharmaceutical Biotechnological Products and Ethical Issues.

NANOBIOTECHNOLOGY

Course code: BTE4315 **Credit Units: 03**

Course Objective:
To evolve a detail understanding into the application of nanotechnology in the field of biological sciences.

Course Contents:

Module I
Biosensors as Precursors of Bioelectronics, Functionlization of Sensing Substrates, Biochip, Nanosensors-Miniaturization of Biosensors, Nanomaterial Based Biosensors.

Module II
Electron Transfer of Biomolecules, Nanoparticle-Biomaterial Hybrid Systems for Sensing and Electronic Devices

Module III
DNA Templated Electronics, Sequence –specific molecular lithography, Single Biomolecule Manipulation for Bioelectronics, DNA as a semiconductor.

Module IV
Applications of nanobiotechnology in medical diagnostics and other biomedical field.

SUMMER INTERNSHIP EVALUATION

Course Code: BTE4335 **Credit Units: 06**

GUIDELINES FOR SUMMER TRAINING

The main objective of summer training is to familiarize students to laboratory environment and make them learn to handle equipments and softwares, design experiments and analyze the results. The student will be supervised by one or more faculty members and he or she will be required to submit a synopsis. While writing a synopsis emphasis should be given to make it publishable. But whether or not the results of a research project are publishable, the project should be communicated in the form of a research report written by the student. Initial drafts should be critiqued by the faculty guide and corrected by the student at each stage.

The File is the principal means by which the work carried out will be assessed and therefore great care should be taken in its preparation.

In general, the File should be comprehensive and include

- A short account of the activities that were undertaken as part of the project;
- A statement about the extent to which the project has achieved its stated goals.
- A statement about the outcomes of the evaluation and dissemination processes engaged in as part of the project;
- Any activities planned but not yet completed as part of the project, or as a future initiative directly resulting from the project;
- Any problems that have arisen that may be useful to document for future reference.

Report Layout

The report should contain the following components:

- TITLE PAGE
- CERTIFICATE
- ACKNOWLEDGEMENT
- ABBREVIATIONS
- CONTENTS WITH PAGE NUMBERS
- CHAPTER –
    a. INTRODUCTION
    b. REVIEW OF LITERATURE
    c. MATERIALS & METHODS
    d. RESULTS & DISCUSSION
    e. SUMMARY AND CONCLUSION
    f. REFERENCES
    g. APPENDIX (OPTIONAL)
- 1 inch Margin on left side & 1”each on other sides.
- Single side of the paper to be used.
- Times New Roman.

Font Size

- 12 (Bold for headings)
- 12 (Normal for Matter)
- 14 (for Chapter Names)
- 1.5 line spacing
- Numbering on the right hand Top of the page
    - Numbers on pages before chapters to be done in Roman at the bottom of the page

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

References
This should include papers and books referred to in the body of the report. These should be ordered alphabetically on the author's surname. The titles of journals preferably should not be abbreviated; if they are, abbreviations must comply with an internationally recognised system.

Examples

For research article
Voravuthikunchai SP, Lortheeranuwat A, Ninrprom T, Popaya W, Pongpaichit S, Supawita T. (2002) Antibacterial activity of Thai medicinal plants against enterohaemorrhagic*Escherichia coli* O157: H7. *ClinMicrobiol Infect*, **8** (suppl 1): 116–117.

For Book
Kowalski,M.(1976) Transduction of effectiveness in *Rhizobium meliloti*. SYMBIOTIC NITROGEN FIXATION PLANTS (editor P.S. Nutman IBP), 7: 63-67

- Scientific names in Italics
- Cover Page containing - Title, Students Name, Supervisors Name, University, Name (along with logo), Course name & year of Submission in the prescribed format
- 2 copies to be submitted

ASSESSMENT OF THE PROJECT FILE
Essentially, marking will be based on the following criteria: the quality of the report, the technical merit of the project and the project execution.. Evaluation will compose of two components - Project report assessment and Viva - voce. Project report assessment will be done by the two internal faculty members in respective fields. A committee of three faculty members will conduct Viva-voce.
Technical merit attempts to assess the quality and depth of the intellectual efforts put into the project will be assessed as per evaluation format.

Examination Scheme:

Project Report	50
Viva Voce	50
Total	**100**

Course Code: BTE4437 **Credit Units: 20**

GUIDELINES FOR PROJECT FILE

Research experience is as close to a professional problem-solving activity as anything in the curriculum. It provides exposure to research methodology and an opportunity to work closely with a faculty guide. It usually requires the use of advanced concepts, a variety of experimental techniques, and state-of-the-art instrumentation.

Research is genuine exploration of the unknown that leads to new knowledge which often warrants publication. But whether or not the results of a research project are publishable, the project should be communicated in the form of a research report written by the student.

Sufficient time should be allowed for satisfactory completion of reports, taking into account that initial drafts should be critiqued by the faculty guide and corrected by the student at each stage.

The File is the principal means by which the work carried out will be assessed and therefore great care should be taken in its preparation.

In general, the File should be comprehensive and include

- A short account of the activities that were undertaken as part of the project;
- A statement about the extent to which the project has achieved its stated goals.
- A statement about the outcomes of the evaluation and dissemination processes engaged in as part of the project;
- Any activities planned but not yet completed as part of the project, or as a future initiative directly resulting from the project;
- Any problems that have arisen that may be useful to document for future reference.

Report Layout

The report should contain the following components:

- **Title or Cover Page**

The title page should contain the following information: Project Title; Student's Name; Course; Year; Supervisor's Name.

- **Acknowledgements** (optional)

Acknowledgment to any advisory or financial assistance received in the course of work may be given.

- **Abstract**

A good"Abstract" should be straight to the point; not too descriptive but fully informative. First paragraph should state what was accomplished with regard to the objectives. The abstract does not have to be an entire summary of the project, but rather a concise summary of the scope and results of the project

- **Table of Contents**

Titles and subtitles are to correspond exactly with those in the text.

- **Introduction**

Here a brief introduction to the problem that is central to the project and an outline of the

Prof. (Dr.) Anil Kumar
Deputy Dean Academics
Amity University Haryana
Manesar, Gurugram
Haryana-122413

Registrar
Amity University Haryana
Manesar Gurgaon-122413

structure of the rest of the report should be provided. The introduction should aim to catch the imagination of the reader, so excessive details should be avoided.

- **Materials and Methods**

This section should aim at experimental designs, materials used. Methodology should be mentioned in details including modifications if any.

- **Results and Discussion**

Present results, discuss and compare these with those from other workers, etc. In writing these section, emphasis should be given on what has been performed and achieved in the course of the work, rather than discuss in detail what is readily available in text books. Avoid abrupt changes in contents from section to section and maintain a lucid flow throughout the thesis. An opening and closing paragraph in every chapter could be included to aid in smooth flow.

Note that in writing the various secions, all figures and tables should as far as possible be next to the associated text, in the same orientation as the main text, numbered, and given appropriate titles or captions. All major equations should also be numbered and unless it is really necessary never write in "point" form.

- **Conclusion**

A conclusion should be the final section in which the outcome of the work is mentioned briefly.

- **Future prospects**

- **Appendices**

The Appendix contains material which is of interest to the reader but not an integral part of the thesis and any problem that have arisen that may be useful to document for future reference.

- **References / Bibliography**

This should include papers and books referred to in the body of the report. These should be ordered alphabetically on the author's surname. The titles of journals preferably should not be abbreviated; if they are, abbreviations must comply with an internationally recognised system.

Examples

For research article

Voravuthikunchai SP, Lortheeranuwat A, Ninrprom T, Popaya W, Pongpaichit S, Supawita T. (2002) Antibacterial activity of Thai medicinal plants against enterohaemorrhagic*Escherichia coli* O157: H7. *ClinMicrobiol Infect*, **8** (suppl 1): 116–117.

For book

Kowalski, M.(1976) Transduction of effectiveness in *Rhizobium meliloti*. SYMBIOTIC NITROGEN FIXATION PLANTS (editor P.S. Nutman IBP), **7**: 63-67

ASSESSMENT OF THE PROJECT FILE

Essentially, marking will be based on the following criteria: the quality of the report, the technical merit of the project and the project execution.
Technical merit attempts to assess the quality and depth of the intellectual efforts put into the project.
Project execution is concerned with assessing how much work has been put in.
The File should fulfill the following ***assessment objectives:***

MACHINE LEARNING-I

Course Code: DSC4102 **Credit Units-03**

Course Contents:

Module 1: An Introduction to Machine Learning:
Introduction to machine learning, What is ML, Types of ML, Applications used for ML, AI vs ML, Essential for ML and AI.

Module 2: Techniques of Machine Learning:
Introduction to Supervised, unsupervised, semi-supervised, and reinforced machine learning techniques

Module 3: Introduction to Supervised Learning:
Training, validation, test data, and Over fitting and complexity

Module 4: Managing and understanding data:
Data description, Data processing, Dimension Reduction.

Module 5: Data Preprocessing:
Comprehend the meaning, process, and importance of data preparation, feature engineering and scaling of datasets.

Module 6: Evaluating model performance:
Measures performance for the classification problem. Discuss different performance measures.

Module 7: Resampling methods:
Discuss different cross validation techniques. Leave-One-Out Cross-Validation, k-Fold Cross Validation

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

Text & References:

STATISTICS & EXPLORATORY DATA ANALYSIS

Course Code: DSC4103 **Credit Units-03**

Course Contents:

Module 1: Descriptive Statistics

Statistics: Preliminary concepts; Measures of Central Tendency: Mean, Median, Mode
Measures of Dispersion: Range, Standard deviation, Variance, Covariance, Graphical Representation of Statistics: Histograms, Bar plots, Scatter plots etc.

Module 2: Probability

Random Experiments, Trial and Event, Sample Space, Mutually Exclusive or Disjoint Events, Mutually Exhaustive Events, Equally Probable Events, Complementary Event, Classical definition of Probability, Statistical definition of Probability, Axiomatic definition of Probability, Addition theorem, Multiplication theorem, Conditional Probability, Bayes' Theorem. Expectation.

Module 3: Continuous Distribution

Normal Distribution, Properties of Normal distribution

Module 4: Correlation

Bivariate distribution Correlation, Types of Correlation, Simple Correlation Coefficient for ungrouped data, Properties and Interpretation of Correlation Coefficient, Coefficient of determination, Scatter diagram, Standard Error, Probable error of Correlation Coefficient. Rank correlation, Some examples.

Module 5: Introduction to the Inferential Statistics

Parameter, Statistic, Null hypothesis, Alternative hypothesis, Critical region, Type1 Error, Type 11 Error, Level of significance, P-value and its applications.
Test of Significance for Small samples: One sample t-test, Paired t-test, Degrees of freedom for t-test, F test for equality of Population variances, Degrees of freedom for F-test.
Test of Significance for Large samples: Normal test for sample mean and population mean, Normal test for two sample means.
Chi-square Test: Test of goodness of fit, Test of Independence of attributes, Degrees of freedom for Chisquare test, Coefficient of contingency, Yates' correction for continuity.
Analysis of Variance: One way and Two way (only Examples)

Module 6: Introduction to Model Building:

Basics of Model building, Definition of a Model, Point estimation, Confidence intervals, Testing

Examination Scheme:

DATABASE MANAGEMENT SYSTEM-I

Course Code: DSC4104 **Credit Units-02**

Course Contents:

- SQL (Structured Query Language)
- Data Definition Language (DDL): Create, Alter and Drop commands
- Data Manipulation Language (DML): Select, Insert, Update, and Delete commands, Basic SQL queries, Integrity constraints on tables,
- Data Control Language Commands(DCL): Grant and Revoke
- SQL Functions
- SQL querying to do operations such as identifying nulls, special characters, blank rows/columns, and run distributions, run data summaries, merge tables, get unique counts
- SQL Joins, Aggregate functions and GROUP BY, Nested queries and sub queries. GROUP BY CLAUSE along basic aggregations such as SUM, COUNT, AVG RANK(), ROWNUM() & DENSE_RANK. UNION and UNION ALL CASE statement
- Introduction to Advanced SQL concepts: Indexes, Sequence, Clusters, Views, Cursors and Triggers, Embedded SQL
- Introduction to SQLITE
- Introduction to NoSQL and its capabilities
- Contrast MySQL with NOSQL
- Introduction to SQLITE
- Introduction to POSTGRESQL

Examination Scheme:

PROGRAMMING TOOL BOX I-R

Course Code: DSC4105 **Credit Units-01**

Course Contents:

Module 1: An Introduction to R
Overview of R programming, applications, usage and comparative study with other softwares and introduction to R for Data Science

Module 2: Setting up R environment and packages
Setting up R environment and install packages and supporting libraries in R

Module 3: Basics of R
Manage your data and work-space, Save your work, How to use R, Data structure in R, Data creation and curation and special function using R

Module 4: File Handling
Reading different file format using R, file handling and processing, writing output file.

Module 5: Graphics using R
Graphics device, Basic plot function, scatter plot, 3-D scatter plot, pairplots, Lineplot, Matplot, Matpoints, Bar plot, Histogram plot, Density plot, Dot plot, Pie chart, Venn diagram, Grid graphics, Lattice, ggplot2, Interactive plotting, combine multiple plots in same graphics screen, save graphics to a file.

Module 6: Programming using R
Conditional Executions, Comparison Operators, Logical Operators, Control Structures, If statements, Ifelse statements, Loops, For loop, While loop, Apply loop family, Other loops,

Module 7: Functions
Define and Call functions, Syntax Rules for functions, Control utilities for functions, Writing own function

Module 8: Advance R
Advance R functions and Regular expressions, Object oriented programming, Building R package

Module 9: Case study

Examination Scheme:

PROGRAMMING TOOL BOX II-PYTHON

Course Code: DSC4106 **Credit Units-01**

Course Contents:

Python Programming

Module 1: Introduction to Python :
Overview of Python, applications, usage and comparative study with other softwares.

Module 2: Basics of Python :
Syntax, Data Types, Variables, Operators, Input/output, Flow of Control (Modules, Branching)

Module 3: Basic Programming with Python :
If, If- else, Nested if-else, Looping, For, While, Nested loops, Control Structure, Break, Continue, Pass,

Module 4: Data Structures of Python :
Strings and Tuples, Accessing Strings, Basic Operations, String slices, Working with Lists, Introduction, Accessing list, Operations, Function and Methods, Files, Modules, Dictionaries, Functions and Functional Programming, Declaring and calling Functions, Declare, assign and retrieve values from Lists, Introducing Tuples, Accessing tuples

Module 5: Advanced Python :
Object Oriented, OOPs concept, Class and object, Attributes, Inheritance, Overloading, Overriding, Data hiding, Operations Exception, Exception Handling, Except clause, Try finally clause, User Defined Exceptions

Module 6: Python Libraries :
Introduction to Machine learning packages like NUMPY, SCIPY, PANDAS etc.

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

BIG DATA TOOLS & TECHNOLOGIES-I

Course Code: DSC4107 **Credit Units-01**

Course Contents:

Module 1: Introduction to Big Data
Big Data and its Importance, V's of Big Data, Drivers for Big Data, Introduction to Big Data Analytics, Big Data Analytics applications.

Module 2: Introduction to Hadoop
Hadoop Introduction, Hadoop key characteristics, Hadoop Core Components, Hadoop Ecosystem, Hadoop Services, Different Hadoop Modes, Hadoop's Parallel World – Data discovery

Module 3: Understanding Hadoop
Hadoop Installation, Hadoop Cluster Setup, Storing Data in Hadoop, HDFS Commands (Basics, Intermediate and Advanced), Processing your data with Map Reduce, Customizing Map Reduce Execution, Building Reliable MapReduce Apps, Run test example using Map reduce, Distributed Cache, Map side join vs Reduce Side Join, Running Hadoop applications

Module 4: Processing Big Data
Integrating disparate data stores, Mapping data to the programming framework, Connecting and extracting data from storage, Transforming data for processing, Subdividing data in preparation for Hadoop Map Reduce.

Module 5: Hadoop Map Reduce
Employing Hadoop Map Reduce,Creating the components of Hadoop Map Reduce jobs, Distributing data processing across server farms, Executing Hadoop Map Reduce jobs, Monitoring the progress of job flows, The Building Blocks of Hadoop Map Reduce, Distinguishing Hadoop daemons, Investigating the Hadoop Distributed File System Selecting appropriate execution modes: local, pseudo-distributed, fully distributed.

INTRODUCTION TO LINUX

Course Code: DSC4108 **Credit Units-01**

Course Contents:

Module 1: Operating System:
Introduction: Windows and Unix/Linux, Definition; Concepts; Function of Operating System; Batch Processing; Multiprogrammed Batch System; Time Sharing System; Parallel System; Distributed System; Real Time System.

Module 2: Process & Memory Management:
Process; Process State(New, Running, Waiting, Ready, Termination); Process Control Block; Process Scheduling (Round Robin Scheduling, Priority Scheduling, Multiple Queues, Shortest Job Scheduling); Operations on Process; Basic Management of Memory; Swapping Virtual Memory; Paging.

Module 3: Input/Output Management:
I/O Devices; Device Controllers; I/O Software; Device Drivers; Deadlock; Resources; Principles of Dead Lock; Detection and Recovery; Deadlock Prevention; Deadlock Avoidance.

Module 4: UNIX/LINUX Operating Systems:
Introduction; Concepts; Layers of UNIX; Role of System Administrator and Ordinary User; Tree Structure of UNIX; Root File System; /bin Directory; /dev Directory; /bin Directory; /etc Directory; /lib Directory; /proc Directory; /mnt Directory; /root Directory; /sbin Directory; /tmp Directory; /var Directory; Relative Path; Absolute Path; Creation of Directory; Creating file; removing file; Listing Files and Directories copying file; renaming file; Changing File Permission; Changing Director Permission; Changing Group; Changing Owner; Pipe; Filters; pwd command; date command; head command; tail command less command; more command; grep command; VI Editor (Creating a new File; Inserting Text in File; Deleting Text in File; Copy , Cut & Paste Text; Save File).

Module 5: Shell Programming:
Variables(Configuration Variable & Environmental Variable); Operators(Arithmetic Operator, Logical Operator, Relational Operator); Instruction(Sequence Control Instruction, Selection Control Instruction, Repetition or Loop Instruction); echo command; read command; outtput command.

Module 6: System Monitoring:
System monitoring, process information, log files, run level, system recovery, Memory management

MACHINE LEARNING-II

Course Code: DSC4201 **Credit Units-03**

Course Contents:

Module 1: Basic concepts to calculate distance and similiraties
Discuss different methods to calculate distance and similrities including euclidean distance, squared euclidean distance, Manhattan distance, Cosine distance, Chebyshev distance, Canberra distance, Minikowski distance, correlation distance, partial correlation distance, mutual information and rank correlation coefficients

Module 2: Introduction to unsupervised learning
Discuss theory and concepts behind unsupervised learning

Module 3: Clustering:
Finding grouping of data. Hierarchical clustering,k-means and K-medoid clustering algorithm

Module 4: Application to Machine Learning:
Classification using Nearest Neighbors, Naive Bayes, Support Vector Machine, Market basket analysis using Association Rules

Module 5: Case study
Solve a case study on real world data and apply machine learning concepts.

REGRESSION THEORY & ANALYSIS

Course Code: DSC4202 **Credit Units-03**

Course Contents:

Module 1: Simple linear regression: Estimation of the Parameters, Hypothesis Testing on the Slope and Intercept, Interval Estimation in Simple Linear Regression, Prediction of New Observations, Coefficient of Determination

Module 2: Multiple regression: Estimation of Parameters, Hypothesis Testing, Confidence Intervals, Prediction

Module 3: Model Adequacy testing: Residual Analysis, PRESS statistic, Lack of Fit

Module 4: Transformations: Variance stabilising transformations, Transformations to linearise the model, Methods to select a transformation, Weighted least squares, Regression and random effect

Module 5: Multicollinearity: Sources, Effects, Diagnostics, Methods of dealing with Multicollinearity

Module 6: Validation of regression models: Techniques for validation

Module 7: Introduction to non linear regression and GLM: Non linear least squares, Transformations, Parameter estimation, Logistic and poisson regression

DATABASE MANAGEMENT SYSTEM-II

Course Code: DSC4204 **Credit Units-02**

Course Contents:

Module 1: MongoDB
A Database for the internet, MongoDB's key features, MongoDB's core server and tools, Why MongoDB? , History of MongoDB, Diving into the MongoDB shell, Creating and Querying with indexes, Basic Administration, Writing Program using MongoDB

Module 2: Application Development in MongoDB
Document oriented data, Constructing queries, Aggregation, Update ,atomic operations and deletes, E-commerce updates, Atomic document processing

Module 3: MongoDB Mastery
Indexing and query optimization, Text Search, Wired Tiger and pluggable storage, Replication, Scaling your system with Sharding, Deployment and Administration

Module 4: Apache Cassandra
Big Data and Apache Cassandra, Importance of Cassandra, Cassandra as a Distributed Database, Cassandra and High Availability, Cassandra and Replication Mechanism, Cassandra's Elastic Scalability, Tune able consistency (Strict Consistency , Casual Consistency , Weak Consistency , Brewer's CAP Theorem ,Cassandra as a Schema Free Database, Where should we use Cassandra , Who and why using the Cassandra

SPARK

Course Code: DSC4205 **Credit Units-01**

Course Contents:

Module 1: Introduction to Apache Spark
Introduction to Apache Spark, Features of Apache Spark, Apache Spark Stack, Introduction to RDD's, RDD's Transformation, What is good and Bad in Map Reduce , Why to use Apache Spark

Module 2: Spark: A Hadoop Replacement?
Java, Scala, or Python? , Scala, Packages, Data Types, Classes, Calling Functions, Operators, Control Structures

Module 3: A Quick Intro to Spark
Starting the shell, Data Sources, Testing Spark, Spark Monitor, Comparing Hadoop Map Reduce to Spark, Writing Standalone program with Spark

Module 4: Spark SQL
Basic Concepts, Using Spark SQL with RDDs

Module 5: Spark Streaming
Basic Concepts, Creating Your First Stream with Scala, Creating Your First Stream with Java

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

DATA VISUALIZATION

Course Code: DSC4206 **Credit Units-01**

Course Contents:

Module 1: Introduction to data visualization:
Introduction to data visualization. Explore and manipulate all graphical parameter.Drawing graphs such as scatterplot, stripchart, histogram, boxplot, violoin chart, bar chart, dot plot, line graph, line plot, multiplot, stacked bar chart, pie diagram, venn diagram, pair plot.Explore 3d chart, motion chart, interactive charts.Discuss selecting appropriate chart for strategy presentation.Save graphs in various formats.Discuss different ways to combine multiple figures. Discuss margin and graph size.

Module 2: Introduction to Tableau:
Creating Visual Analytics with Tableau Desktop, Connecting to your data, Building your first visualization, Creating Calculations to enhance your data, using maps to improve insight, developing an Ad Hoc Analysis Environment, Tips Tricks and Time Savers, Bringing it all together with dashboards. Installing Tableau Server, Using Tableau server to facilitate fact based team collaboration, Automating Server with Tableau's command line tools, Use case for rapid fire visual analytics, other Tools. Explore various case studies to visualize the data.

Examination Scheme:

BIG DATA TOOLS & TECHNOLOGIES-II

Course Code: DSC4207 **Credit Units-01**

Course Contents:

Module 1: Fundamental of Apache Pig
What is Pig?, Introduction to Pig Data Flow Engine, Pig and Map Reduce in Detail, When should Pig Used?, Pig and Hadoop Cluster, Pig Interpreter and Map Reduce, Pig Relations and Data Types, Pig example in Detail, Debugging and Generating Example in Apache Pig

Pig philosophy and architecture, Pig installation, Grunt shell, Loading data, Exploring Pig Latin commands, Pig Transformations functions, Joins in Pig, Hands on Exercises

Module 2: Fundamental of Apache Hive
What is Hive?, Architecture of Hive, Hive Services, Hive Clients, How Hive Differs from Traditional RDBMS, Introduction to HiveQL, Data Types and File Formats in Hive, File Encoding , Common problems while working with Hive

Hive architecture, Hive installation, Hive vs. RDBMS, HiveQL and the Hive shell, Data types and schemas, Creating tables (external vs. managed), Creating Partitions, Creating Views, UDF function in java in Hive, Using hive to create diff types of format

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**
15	10	05	35	15	10	10

Text & References:

- Programming PiG, Wiley Publication, Alan Gates
- Programming Hive, Wiley Publication, Jason Rutherglen, Dean Wamplor & Edward Capriolo

MACHINE LEARNING-II LAB

Course Code: DSC4208 **Credit Units-01**

Course Contents:

Module 1: Basic concepts to calculate distance and similirities
Discuss different methods to calculate distance and similrities including euclidean distance, squared euclidean distance, Manhattan distance, Cosine distance, Chebyshev distance, Canberra distance, Minikowski distance, correlation distance, partial correlation distance, mutual information and rank correlation coefficients

Module 2: Clustering:
Finding grouping of data. Hierarchical clustering,k-means and K-medoid clustering algorithm

Module 3: Application to Machine Learning:
Solve a case study on real world data and apply machine learning concepts. Classification using Nearest Neighbors, Naive Bayes, Support Vector Machine, Market basket analysis using Association Rules

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**
15	10	05	35	15	10	10

REGRESSION THEORY & ANALYSIS LAB

Course Code: DSC4209 **Credit Units-01**

Course Contents:

Module 1: Simple linear regression:
Estimation of the Parameters, Hypothesis Testing on the Slope and Intercept, Interval Estimation in Simple Linear Regression, Prediction of New Observations, Coefficient of Determination through case studies

Module 2: Multiple regression:
Estimation of Parameters, Hypothesis Testing, Confidence Intervals, Prediction through case studies

Module 3: Model Adequacy testing:
ResidualAnalysis, PRESS statistic, Lack of Fit through case studies

Module 4: Multicollinearity:
Sources, Effects, Diagnostics, Methods of dealing with Multicollinearity through case studies

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**
15	10	05	35	15	10	10

DATA STRUCTURE & ALGORITHM DESIGN LAB

Course Code: DSC4210 **Credit Units-01**

Course Contents:

Module I
Stack implementation through arrays, link list

Module II
Programs for recursion functions

Module III
Implementation of queues and leap structures

Module IV
Application of binary trees in pre-order, post-order and in-order evaluation

Module V
A VL tree implementation

Module VI
Optimal matrix multiplication

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

PATTERN RECOGNITION

Course Code: DSC4211 **Credit Units-01**

Course Contents:

Statistical Pattern Recognition

Introduction, Gaussian model, discriminant functions, classifier performance, risk and errors; supervised learning using parametric and nonparametric approaches: ML estimation, Bayesian parameter estimation approach, Parzen Windows, k-nn estimation; Unsupervised learning and clustering: the clustering concept, c-means algorithm, learning vector quantization, clustering strategies, a hierarchical clustering procedure.

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**
15	10	05	35	15	10	10

NEXT GENERATION SEQUENCING ANALYSIS

Course Code: DSC4212 **Credit Units-01**

Course Contents:

Module 1: Introduction to NGS and NGS Technologies
Introduction to sequencing technologies from a data analysts view, Concept, Applications of sequencing technologies in Whole genome assembly; Gene expression analysis; Genome annotation; Gene regulation analysis; Variation studies

Module 2: NGS data analysis: Preprocessing
Introduction to NGS data analysis, Raw sequence files (FASTQ format), Preprocessing of raw reads: quality control (FastQC), adapter clipping, quality trimming, Introduction to read mapping (Alignment methods, Mapping heuristics), Read alignment to a reference genome (BWA, Bowtie2, TopHat), Mapping output (SAM/BAM format), Usage of important NGS toolkits (samtools, BEDtools), Mapping statistics, Visualization of mapped reads (IGV, UCSC)

Module 3: NGS data analysis: Variant calling
DNA variant calling and Filtering DNA variants using GATK pipeline

Module 4: NGS data analysis: Gene Expression Analysis
Genomics and transcriptome assembly, Differential Expression analysis, Quantification of expression,

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

ASSOCIATION RULE MINING

Course Code: DSC4213 **Credit Units-01**

Course Contents:

Where Is Association Learning Used? , Web Usage Mining, Beer and Diapers, How Association Rules Learning Works, Support, Confidence, Lift, Conviction, Defining the process, Algorithms(Apriori, FP-Growth), Mining the Baskets- Market basket analysis

Examination Scheme:

IA			EE			
Class Test (Practical Based)	**Mid Term Viva**	**Attendance**	**Major Experiment**	**Minor Experiment/Spotting**	**Practical Record**	**Viva**

GENERALIZED & LINEAR MODELING

Course Code: DSC4301 **Credit Units-03**

Course Contents:

Module 1: Introduction to Generalized Linear Models:
Linear model, Non linear model, GLM

Module 2: Linear Regression Models:
Multiple regression model, Parameter estimation, Maximum likelihood, Model adequacy checking, Weighted least squares

Module 3: Nonlinear Regression Models:
Linear and Non linear regression models, transforming a linear model, Parameter estimation

Module 4: Logistic and Poisson Regression Models:
Logistic regression, Poison regression, Overdispersion

Module 5: The Generalized Linear Model: Exponential family, Likelihood equations, Quasi likelihood, Gamma family, The power function, Generalized Estimating Equation

Examination Scheme:

Components	CT	Attendance	Assignment/ Project/Seminar/Quiz	EE
Weightage (%)	15	5	10	70

DEEP LEARNING & NEURAL NETWORKS

Course Code: DSC4302 **Credit Units-03**

Course Contents:

Module 1: Introduction to deep learning:
Conceptual overview of neural network, Supervised Learning with Neural Networks, Deep neural network, Why is Deep Learning a Buzz word

Module 2: Neural Networks Basics:
